No, there isn't.

> You just can't stand it so you whine and carry on in denial.

I'll leave denial, whining and carrying on to you. You're much better
at it.
;-) ;-) ;-)

> Don't make such a scene in public with your denial whining.

Your transference is showing.

> It spoils your image as a long-time superior amateur radio person.

Why are you, who styles himself as a long-time superior nonamateur
radio person, so concerned? You get awfully upset when someone
disagrees with you. You just can't deal with diversity of opinion, or
strong opposition to your cherished views.

My best guess is if they made a mistake, and not wanting to admit they were wrong, plowed ahead anyway.

To his good credit, Mr Brock did admit his mistake, I believe. Others seem willing to take up the fight to make themselves look foolish.

And your point about:

"good engineering practice": FCC rules." does indicate that there would be no 1/4 wave dipole question on the exams.

I was certainly taught how to use a Smith chart in engineering school. Not only that, but how to derive the axes mathematically. The latter I have forgotten, but I will never forget how to use one. There again, I went to engineering school in Emgland, where you don't have to do 'English 101' or 'Western Civilization' if you study engineering, hence sufficient time to learn about Smith Charts!

OK, Lloyd, you got me. This post was the result of a problem with a friend (since passed) about 20 or 25 years ago. There was a neighbor (by the lingo, obviously CB) that was coming into here telephone, radio, stereo, and electronic organ. The neighbor in question (yes, I could see the antenna) was perhaps 150 or 200 feet away. Having seen susceptibility in an identical organ (5 watt cb units passing 50 feet away were barely heard; once in a while one would really pound in, which indicated excessive power), I knew the individual in question was likely running in the low hundreds of watts. My take was "ya can't work 'em if ya can't hear 'em". As was pointed out, a Briggs is hard to hide. Well, if he could hear the lawnmower and thought it the source of interference, he'd likely stop over. I'm sure a reasonable chat (no, no fisticuffs) could work things out. Certainly, as I stated, this is *not* recommended. Try and make someone believe that bell wire "accidentally" fell on the sparkplug and the other end just happens to be connected to an insulator. :)

Uh - could I plead "senior moment"?

Believe it. The top gun rcvrs in those days with even half decent
selectivity were built by Collins and cost 7-8 weeks worth of an
average engineer's entire paychecks. Today much better rcvrs are
available for 10-12 *days* worth of his/her paychecks. Radio kids had
it really miserable, it took me a whole summer to earn enough money to
buy a monumental crapper S-40B rcvr from Sears. Seven QSOs at a time?
No problem! Had the same selectivity characteristics as one of today's
$10-20 throwaway pocket AM/FM broadcast rcvrs. Maybe worse. Ya could
hear a dozen or so stations when the band was really cooking, half
were real signals and the other half were images & intermod products.
Then came the drift . . "Golden Days" my ass . . !

> I wish there had been that much activity when I was willing to go thru
> the ordeal.

The Novice bands of those days are about the only aspect of 'wayback
radio I wish we still had.

Yep, I just don't get it at all. I think they're the ones that got snookered.

Well, DICK, hopefully you can get an antenna to radiate because I'm pretty darned sure nothing else is radiating there.

I have used my DXCC antenna many, many times over the years on MARS nets, with a Yaesu transceiver with automatic tuner. Now, maybe it's not a "constructed" dipole, but it was used nevertheless. Also, what's the big deal with a 1/4 wave dipole? Dipole simply means design of the antenna...granted, usually for 1/2 wave, which, as you know, doesn't require a groundplane. But there is no reason a 1/2 wave dipole could not be constructed.

Also, perhaps you could tell me the resonant frequency of a long-wire antenna? Eh?

You aked why, then you can't deal with the answer.

You say EE schools don't teach the Smith Chart, then you cay you can
name one that does, but then won't.

You say that Smith Charts are easy to learn, and won't keep anyone out
of the Amateur Service, but there are far far fewer Smith Chart users
than Morse Code users, and Morse Code keeps people out of the ARS.

You're acting obtuse. Are you Dave in drag?

>I don't know. Although the posts to the ng haven't changed over the
>years, people and positions do change.

Maybe. From what I've seen, there's more change in the posts than in people's
positions.

>I've had a few people post
>dissatisfaction with the knowledge level of the current testing and
>they seem to agree that the current tests allow people to be licensed
>that don't know protocols or even how to set up and operate the
>equipment.

Agreed! But I have also seen lots of stuff in the other direction. Check out
the flak I'm getting from the irony-impaired over the "Smith Chart Test" post.

The people that need convincing are the FCC, and from their actions over the
past 25+ years it looks to me like they are not about to improve the written
tests.

>Your proposal sounds like a step in the right direction.

Thanks - but I imagine that W5YI and NCVEC would oppose it even more bitterly
than the code test.

>>>I'm sure that not everyone will agree with performance based testing
>>>in addition to a written test.
>>

>>That's an understatement. Google up the responses I got from the above post.
>>Some of 'em aren't pretty.
>>
>>>However, perhaps a consensus could be reached.
>>
>>Even if that happens, the FCC then has to be sold on the idea.
>
>If a consensus was reached in the ham coumunity that testing was
>inadequate at its current level, would selling the idea to them really
>be that hard?

Probably - but I doubt we'd ever get a consensus anyway. FCC is into deregulation; their actions speak louder than words.

>Afterall, it hams who would have to bear the burden of
>administering the additional test requirements.

And they complain loudest of all. Look at the NCVEC petition - they talk about the code tests being a burden on the VEs. Huh? Play the tape, check the answer sheets for 7 or more correct fillins or 25 correct characters. If that's a "burden", what do you think NCVEC will say about having to have an actual simulated QSO?

>I don't think that
>anyone wants to see people licensed to operate radios who don't know
>the basics of setting them up and using them within established
>protocols.

You'll get no argument from me on that idea, but you WILL get one from other folks over whose protocols should be followed and what constitutes following them.

>So, how would we go about starting a movement towards perfromance
>based testing? I would be willing to do what I could to help.

You could start by writing up a petition to the FCC suggesting replacement of the code test with an operating skills test. Use my description if you want, modiufy it, whatever. There are 8 petitions now, what could one more hurt?

The big stumbling blocks that I see are:

- NCVEC will have a fit.
- Some hams will too.
- You need an objective testing and marking method that minimizes the need for VE judgement
- You need to convince FCC that we really *need* this sort of test, and that serious problems will result without it. (That's the toughest part.)

Good luck!

Not me. I'm looking forward to the next 36 years.

>Plus the creeping crankies start to set in, and you have
>a ripe field for "It ain't as good as it used to be" syndrome to set in.

I think *most* humans have a built-in memory mechanism that tends to remember
the good things more than the bad ones. (Otherwise most women would never have
a second child!) Also, we know how the past turned out, while we don't know how
the future will. So there's a natural tendency to pretty up the past.

That doesn't mean that all eras are the same. Maybe it really WAS a "golden
age". Certainly some things in ham radio were better back then. And some things

are better now. We can learn a lot from those times. The good things can be preserved and the bad things improved.

> Nothing is ever as good as it used to be! And never was.

"The good old days weren't always good
Tomorrow's not as bad as it seems" - Billy Joel

"And the seasons, they go round and round
And the painted ponies go up and down
We're captive on the carousel of time
We can't return, we can only look
Behind to to where we came
And go round and round and round in the Circle Game" - Joni Mitchell

Dan,
If your response here is to me and not Larry, you are way off the mark.
The ones here are the ones that were dodging the draft by either using their republican friends influence somehow/someway or staying stateside in the guard. More of the "who ya know" syndrome. Maybe some of the lower level employees were, but the upper management are definitely not the "flower child" type.

Thanks for all of the wonderful responses and I am definitely feeling alot
better. I am not back to 100% but getting there over the next couple of
weeks or so.

I had corrective surgery to repair a problem in my lower back as a result of
being in a car accident in 1997. Thank god it isn't vertebrae related.
According to the doc, I shouldn't have any more problems as long as this
heals properly.

Thanks again,

Depends.... Apparently hams here as well as in the real world think that
every single person is aware of ham radio and has a basic understanding of
it. I would think that it may actually attract a few more people just
because it is something new they haven't seen before. The fact that it is
yet another "device" that can be connected to a PC might offer some intrigue
as well.

Probably the burning setup, only because they could immediately use the
system that night, whereas it would be a minimum of at least 2-4 weeks or
more before they could use the other system, at least to transmit.
Reception needs no license.

My only main issue with these questions above, as a whole is, which group of 14-17 year olds are you referring to?? There is clear demographical differences in the teenage age groups. There are some clearly that should be immediately shipped to prison to save the justice system some time and at the extreme other end there are some who will be our next Nobel prize winners, and alot of different types in between.

Larry,

This is sort of what I have been saying all along. There are plenty of people out there that might be interested, (regardless of the state of testing methods and requirements) but are unaware that amateur radio even exists!!!!
Of course the argument that "kids" are running to internet is true. Ya can't run to something if you didn't know it existed in the first place......

I don't know if they should plow every dime, but there definitely needs to be a good percentage of the annual budget for PROMOTION, or a good offense to use a sports term. The other funds other than expenses of doing business, should obviously be for defense, i.e methods of alerting FCC officials as well as elected members of the congress and senate as they DO have influence on the various departments/commisions etc. including the FCC.

This should not only be an ARRL effort but it should also extend to other organizations as well as on the immediate local level. I have said it before and I will say it again, I bet for somewhere under $100,000, I (or others) could make wonderful PSA commercial, and even a full 30 minute show that could be place on a medium that could be aired over radio and television, make enough copies of these to get to the radio and television stations, and cover the cost of shipping to them as well for that amount. 100 grand is a smaller chunk of change, looking at the big picture. Radio and television are REQUIRED to air a certain percentage of these PSA's of their broadcast day.

>
> 3. Get the ARRL to plow every dime's worth of it's net worth into a national,
> televised advertising campaign. Get ham radio into the public eye, and stress
> the FUN, not the public service (i.e. the work and worry).
>

Excellent idea. And using a good cross-section of existing celebrity hams, as well as getting other people that are celebrities involved and licensed as well would be a good thing too.

> 4. Get the ARRL to enlist the assistance of any and all celebrity hams in the
> accomplishment of #3 above.

Yeah Larry, now with my back injury and the head injury I have now when I fell out of my chair laughing so hard reading that, and hit my head, I look like a war victim now!!!!!!! :)

Great Googely Moogely!!!

Yeah... the way they drive on 96, 94, 696, 75 and other highways down there, I would too! The only thing I DON'T miss about living in the Detroit metro area where I grew up, is the traffic and of course those really long asphalt parking lots they put in the city around 7am and 5pm every day.

Larry, ask the troll about my "broadcasting", if you want a giggle. The guys at rec.radio.amateur.digital.misc all got a good laugh out of this individual's ranting over there, but finally it got old and we ran him off - apparently to roost again over here.

If his behavior at the other news group is any guide, he will not move on until he has been thoroughly humiliated, setting himself up as the butt of public ridicule here.

Well, I say the sooner it starts, the sooner it will be over and we'll be rid of one more troll. Ask the guy about my "broadcasting" career... That ought to get him off to a good start.

'zactly. No other option. The Novice was not supposed to be a permanent license. That's why it had so few privileges and was so focused,

And the old Novice had another feature - it was a one-time one year license until 1967, when it became two years. Which meant that you either upgraded before the license ran out or you were off the air. The Novice year/2 years was a big learning time. Lotta incentive!

In fact, one of the reasons FCC gave us incentive licensing was that they perceived a drop off in learning after the Novice year.

Most sensible newbies in those times had at least a receiver and antenna set up and working before they went for the Novice exam. They'd spent serious time listening to hams on the air before ever taking a test. They knew which bands were best at various times of day and year simply from observation. They developed a lot of operating skills and knowledge of operating practices before ever getting a transmitter.

When the Novice became 5 year renewable, that incentive went away.

We're not going to get the mfrs. to stop making IC-706s and start making S-40s, so what's the solution?

There's an element of truth in that I guess but there are much younger
ops out there today who are real hotshots and who didn't go thru the
masochistic nonsense us OFs had to put up with.

The biggest benefit I got out of participating in that scene was to
pointedly drive home my need to acquire an education which I could
leverage into a higher than average income. So that I could eventually
afford Collins gear. Which is exactly what I did. Incentives in ham
radio did *not* start with Incentive Licensing in 1968 . . .

St Louis, Mo 63123
harry@earth2.net ,

Petitioners.

---
1. Introduction

This petition addresses the following areas with respect to the
Amateur Radio Service: 1. Consolidation of license classes;
2. Frequency and Mode Privilege reallocation; and
3. Examination Requirements.

Petitioners have designed this Petition with the goal of reducing the Commission's workload and streamlining the Commission's record-keeping requirements, as well as those of Volunteer Examiner Coordinators, Volunteer Examiners, licensees, and candidates for license.

Petitioners suggest that implementation of these proposals would provide encouragement to all Amateur Radio Service licensees to take advantage of educational opportunities and individual experimentation, thus further enhancing their ability to contribute to the radio art.

2. Background and Discussion

2.1 Consolidation of License Classes

Between February 14, 1991 and July 5, 1991, the Commission granted 1,925 new Technician class licenses under the no-code provisions. Petitioners' research shows that 1,880 of those licenses have not been renewed or upgraded to a higher class license and are beyond the two year grace period. That equates to a retention rate of only 2.3%.

Petitioners' further research using the Universal Licensing System search function was blocked because licenses are shown as 'active' until the expiration of the grace period, and there is no provision for search using multiple date parameters. However, based on this limited data, one of two conclusions may be reached. Either the no-code licensing provision did not attract individuals with any depth of interest in radio communications, or the lack of access to frequencies below 30MHz frustrated those newly licensed individuals to the point of giving up. Given either interpretation, Petitioners suggest the no-code Technician experiment did in fact attract larger numbers of people, as was initially hoped, but apparently did not offer sufficient opportunity for them to expand their knowledge and skills, nor did these individuals bring long-term benefit to the Amateur Radio Service.

On December 30, 1999 Report and Order, the Commission stated, 'We observe that the primary difference between the Advanced Class operator license and the Amateur Extra Class operator license is not the difficulty of the Amateur Extra Class written examination but, rather, the 20 wpm telegraphy examination which, as we explain below, we are eliminating as a requirement to obtain the Amateur Extra Class operator license. We also agree with NCVEC that the difference in authorized frequency privileges between the Advanced Class operator license and the Amateur Extra Class operator license is minimal and does not alone warrant maintaining two separate license classes in the future.'

The Commission declined, at that time, to 'undertake a comprehensive restructuring of the amateur service operating privileges and frequencies' until the amateur community reached consensus.

The Commission also left orphaned the Novice class amateur radio license.

Petitioners suggest there is overwhelming consensus in the amateur community that these two orphaned classes should be integrated back into the mainstream of the amateur community.

2.2 Frequency and Mode Privilege reallocation

On December 30, 1999 the Commission released its Report and Order revising the Amateur Radio Service license structure and International Morse code testing requirements. The Commission declined, at that time, to 'undertake a comprehensive restructuring of the amateur service operating privileges and frequencies' until the amateur community reached consensus.

As stated in 2.1 Petitioners suggest there is overwhelming consensus in the amateur community to merge the two orphaned classes. This action will streamline the Commission's record keeping needs and simplify the maintenance of frequency and mode privilege allocations.

Upon merging the Novice and Technician as well as the Advanced and Amateur Extra license classes, considering the ITU action and the growing consensus among the Amateur community, given the no-code VHF only Technician experiment has attracted far fewer dedicated, long term operators than desired, and noting that a significant number of new entrants into the Amateur Radio Service have a strong interest in new technologies and digital modes, it seems only reasonable to modify the frequency and mode allocations for the new, consolidated, Technician class.

Petitioners have examined the history of U.S. frequency allocation. It appears that the Commission has always tried to protect the new, inexperienced, operators from their own lack of experience by putting their privileges away from the band edges and by limiting them in power output. Examples of this are the Novice allocations on 80, 40, and 15 meters and the Novice and Technician Plus allocations on the 10-meter Band. Since the HF spectrum is the area in which international communications are prevalent, these allocations minimized the possibility of interference to other services. The amateur community generally agrees this procedure is in the best interest of the Amateur Radio Service.

2.3 Examination Requirements

On December 30, 1999 the Commission released its Report and Order revising the Amateur Radio Service license structure and International Morse code testing requirements. At that time, the Commission reduced the telegraphy examinations from three elements to one, and set the number of written examination questions required at 35 for Technician, 35 for General, and 50 for Extra, and left to the National Council of Volunteer Examiner Coordinators (NCVEC) the task of the specific mix and makeup of written examination tests.

The Commission did, however, encourage the Amateur Service to strive to 'attract technically inclined persons, particularly the youth of our country, and encourage them to learn and to prepare themselves in

the areas where the United States needs expertise.'

Further, the Commission specifically addressed its desire to 'provide an incentive for licensees to continue the educational opportunities offered by amateur radio as The American Radio Relay League, Inc. (ARRL) requests, will continue to provide an incentive for amateur radio operators to advance their communication and technical skills,' and to encourage individuals in the Amateur Service to become 'trained operators, technicians, and electronic experts.' The Commission also said, 'In reaching this decision, we note that one of the fundamental purposes underlying our Part 97 rules is to accommodate the amateur radio operator's proven ability to contribute to the advancement of the radio art.?'

The ITU has, in its 2003 Conference, left to individual administrations whether candidates for the Amateur Radio Service should demonstrate proficiency in International Morse code.

The ITU also adopted the following new language in Provision 25.6: 'Administrations shall verify the operational and technical qualifications of any person wishing to operate an amateur station. Guidance for standards of competence may be found in the most recent version of Recommendation ITU-R M.1544.'

There has been great debate in the amateur community over the retention of code testing. Petitioners observe that, in most of these discussions, the issue of technical competence arises as a major point. There appear to be three groups in these discussions, one which advocates complete elimination of code testing. A majority of this group either advocates increasing the difficulty of written elements or concedes that it is necessary. A second group advocates nothing short of retaining code testing as a 'make or break' element. Most members of this group agree the current written test elements are seriously deficient. The third falls in the middle ground on the code issue. Amateurs in this group also agree that the written testing elements should be enhanced to adequately assess a candidate's knowledge and ability.

Based on these observations, Petitioners see a need for continued International Morse code testing, but do not believe code testing should be the main determining factor. Similarly, Petitioners see a need for more comprehensive written examinations.

Petitioners have attempted to objectively analyze activity levels for the various modes in three categories, International Morse code (CW), Phone (primarily SSB), and Digital (all types) on the high frequency bands. The complete study, prepared by Mr. Walter B. Fair, W5ALT, is included with his permission as Attachment A. The following paragraph in the conclusion section of this report should be noted:

"Based on the analyses presented below, it appears that the CW issue in ham radio is often based on emotion rather than fact. The data do

not indicate an overall decrease in CW activity. The argument being used by CW opponents that CW is dying seems to have no merit. On the other hand, the argument that relaxing the CW test requirement to 5 WPM would lead to the destruction of the Amateur Radio Service does not seem to have merit, either. The data show that when the code testing was relaxed in 2000, CW activity remained stable in the following years. Therefore, if more newer hams started using SSB, the same percentage also started using CW. I interpret that to mean that most hams will use the mode that meets their objectives, whether it is CW or not. Of course, there will always be vocal minorities in both the pro and con CW camps."

Petitioners suggest as a single mode of operation International Morse code is alive, well, and apparently used by a large portion of the Amateur Community. Especially in light of the major role the CW mode plays in international communications, Petitioners suggest that eliminating International Morse code testing altogether would be a tremendous disservice to the U.S. amateur community.

Following the elimination of Amateur Radio Service testing at Commission Field Offices, the concept of Certificate of Successful Completion of Examination (CSCE) was introduced. The system of CSCEs is now pervasive, and presents a significant paperwork and record-keeping burden on Volunteer Examiner Coordinators, Volunteer Examiners, licensees, and candidates for license.

3. Scope of Proposals

3.1 Consolidation of license classes

3.1.1 As per paragraph 2.1, Petitioners suggest it is time to consolidate the Novice and Technician and Technician Plus licenses into one Technician license. This would allow the Commission to simplify record keeping and bring the orphaned Novice licensees back into the Commission's license progression scheme. The upgrade procedure would be automatic immediately and the new license issued at the normal renewal time.

3.1.2 As per paragraph 2.1, Petitioners further suggest it is time to consolidate the Advanced and Amateur Extra licenses. This would also simplify the Commissions record keeping and upgrade these operators who have all passed examination elements with requirements higher than, or equal to those required today. The upgrade procedure would be automatic immediately and the new license issued at the normal renewal time.

3.2 Frequency, Power, and Mode Privilege reallocation;

3.2.1 Petitioners recommend that the newly revised Technician license should have privileges as outlined in paragraph 4.2 below. This allows in general:

. 1. 80 meters: CW and data privileges on 3600 though 3750 kHz. This is an increase of 100 kHz of bandwidth and the addition of data modes to the present Novice allocation.
2. 40 meters: CW and data privileges on 7100 through 7150 kHz. This adds data modes to the existing Novice allocations.

3. 15 meters: CW and data privileges on 21100 through 21200 kHz. This adds data modes to the existing Novice frequency allocations.

4. 10 meters: CW and data privileges on 28100 through 28300 kHz. This represents no change to the existing Novice and Technician Plus allocations.

5. 10 meters: CW and Voice privileges on 28300 through 28600 kHz. This is an increase of 100 kHz of bandwidth to the existing Novice and Technician Plus allocations.

6. Above 30 Mhz: All frequencies, modes, and power levels as contained in the current regulations.

3.2.2 Petitioners recommend that power limitations be placed on the newly consolidated Technician Class in the same fashion as has been historically imposed on the lowest beginner class of operator license in the allocated HF frequencies. This limitation protects other users of the HF spectrum from inadvertent errors commonly made by the inexperienced operator. Petitioners recommend a 200 Watt limit for the Technician class license on all frequencies below 30 Mhz as indicated in paragraph 4.2.3.

3.2.3 Petitioners recommend, upon merging the Advanced and Amateur Extra license classes, that the newly revised Amateur Extra class be assigned all those privileges allowed the present Amateur Extra class license.

3.3 Examination Requirements

3.3.1 As per paragraph 2.3, Petitioners suggest it is time to review and make certain changes to the Element 1 (International Morse code) testing requirement. In light of the ITU's actions it is indeed time to regard the International Morse code as another mode of operation equal to but of no greater importance than any other mode. As demonstrating competence in other modes is not necessary to gain access the HF frequencies, it occurs to the Petitioners that it is time to remove this as an absolute requirement. Petitioners suggest, however, that International Morse code testing should be continued as part of the overall license examination for good reason, as discussed in Section 2.3.3.

3.3.2 It is believed by the Petitioners that the International Morse code remains a viable, valuable, and popular mode. See the discussion in 2.3 above. When all else fails in emergency circumstances, International Morse code remains as the only useable option. CW is also an "International Language", by which, peoples of the world who have differing spoken languages can communicate efficiently.

Petitioners note that written examinations for all classes include questions designed to ascertain a candidate's knowledge of various modes. This petition proposes that, while written examination questions are sufficient to evaluate a license candidate's familiarity with the basic concepts of other modes, such testing is not sufficient for International Morse code.

Petitioners recommend that testing of International Morse code be continued but that such testing should be integrated into the overall test score in a more equitable fashion. It is recommended that the Element 1 test should be scored such that the longest string of continuous characters should be counted (with numbers and punctuation being weighted as two characters) and such count, up to a maximum of 24, should be then divided by two and the result added to the score of the written examination. This test would be available to all candidates for every class of license.

3.3.3 As per paragraph 2.3 it is further believed by Petitioners that is time to increase the number of written test items required to successfully indicate competence at all license levels.

Petitioners have analyzed current and previous question pools developed by the NCVEC and found that the current examinations do not assess candidates' required knowledge of technical matters and the Commission Rules and Regulations as thoroughly as in the past. This due, in large measure, to the limitation of actual test question numbers for Technician and General at 35, and for Amateur Extra at 50. To its credit, the NCVEC has responded to this limitation by greatly expanding the number of questions in each question pool.

Petitioners suggest the actual test questions, however, have been significantly more slanted toward procedures, and less toward technical competence and regulations. This is due to the limitation on the number of actual examination questions.

Petitioners present the following examples:

. 1. Individuals who achieved the 1997 Technician license had passed two written examination elements totaling 65 questions, of which fifteen (23%) were in the area of Commission Rules. Technicians today encounter a total of just 35 written examination questions, only five (14%) of which are in the Commission Rules category. All five may be answered incorrectly, plus four more in other areas, and the candidate will still achieve a passing score.
2. Of the 65 total questions in the Novice and Technician examinations in 1997, there were four questions dealing with propagation. In the current 35 question Technician examination, there are only two.

3. The Novice and Technician examinations in 1997, combined, had ten questions (15%) dealing with electronic theory and components. The current Technician examination has just three (8%).

4. A person achieving a General class license in 1998 encountered a total of 95 test questions. Of those, nineteen were in the Commission Rules category. A person-achieving General today faces 70 questions, eleven of which fall in that category.

5. The cumulative examinations necessary for a General class license in 1998 contained seven questions dealing with propagation. The cumulative examinations necessary for General today contain only five propagation questions.

6. The 95 questions leading to a General class license in 1998 included thirteen (13%) on electronic theory and components. The 70 questions leading to General today include only six (8%).

Petitioners' comparative research of prior question pools was incomplete because neither the NCVEC nor, apparently, any of its entities maintain them as archive material. Fortunately, some of the question pools of interest were recovered from non-official sources. Future studies undertaken as part of rule making proceedings would benefit from their prolonged availability.

The increasing complexity of the radio art, combined with the elimination of Novice and Advanced licenses, have outstripped the ability of a 35 question examination for Technician and General, and a 50 question examination for Amateur Extra to sufficiently evaluate a candidate's operational and technical qualifications. Petitioners suggest that increasing both the number of questions required for each class and the minimum passing scores, as well as assuring a technical and regulatory focus are reasonable solutions. The testing requirements as outlined below would restore the number of examination questions and the number of required correct answers to an approximation of the pre-April 15, 2000 requirements for Technician, General, and Amateur Extra licenses.

Petitioners have observed a widespread recognition in the amateur community that the current examination structure allows individuals who learn published question and answer material quickly to rapidly advance in license class without gaining real understanding of the underlying material. Therefore, this proposal incorporates a requirement for minimum experience in each class of license prior to advancing to the next. Petitioners suggest this will provide practical experience, encourage experimentation and help develop well trained operators, technicians, and electronic experts.

3.3.4 Petitioners suggest it is incumbent on the Commission to mandate the specific mix of topics, number of questions, and minimum passing requirement for all Amateur Radio Service written examinations. It is not, however, necessary at this time for the Commission to develop the actual question pools. This task could very well remain in the hands of the NCVEC.

Petitioners recommend a written test length of forty-four questions for the Technician license (each question scored as two points) and

eighty-eight questions for the General and Amateur Extra license (each question having a value of one point), with questions to be divided into six categories as indicated in paragraph 4.3.

The final score for the license examination would be the sum of the Element 1 exam and the score on the written portion giving a total possible of 100 points. A total cumulative score of 75 points would be the minimum passing grade. This method of integrating the Element 1 test and the written examination allows two paths for progression within the Amateur Radio Service; first, for the technically talented individual to obtain an amateur license in the upper levels of the service without the absolute necessity of learning the International Morse code and second, the more traditionally skilled communicator to receive credit for his extended capabilities, thus bringing into balance the mandates of 47CFR97.1.

3.3.5 Given the composite nature of the examinations suggested by Petitioners, there would no longer be a need to issue CSCEs, and to continue their issuance would in fact be impractical.

3.3.6 Petitioners recognize there have been thousands of CSCE documents issued by VEs and that the holders of these documents should be credited for the hard work the CSCE represents. Petitioners recommend that the holder of an Element 1 CSCE issued prior to the date of the Commission's Order in this matter be credited with 12 points in lieu of the Element 1 examination. Petitioners further recommend the holder of an element 3 or 4 CSCE issued prior to the date of the Commission's Order in this matter be credited with 65 points in lieu of the respective examination.

3.3.7 Petitioners have analyzed the existing testing procedure and believe this proposal offers the most balanced and seamless integration approach possible. Considering the following scenarios, it will be seen that it offers more options for individuals to enter the Amateur Radio Service while assuring the individual has the knowledge necessary to properly control a radio station with minimum opportunity for causing interference to other services.

Candidates scoring the maximum 12 points in the Element 1 portion of the composite examination will need 63 additional points to obtain a license. For the Technician license this would require 32 out of the possible 44 questions. This would be 72.7% correct necessary to pass. For the General or Amateur Extra, it would require 63 out of the possible 88 questions, or 71.5% correct to pass. Both figures indicate that the candidate has at least minimum knowledge to properly control an amateur station and should be eligible for a license.

Candidates scoring a zero in the Element 1 portion of the composite examination will need 75 additional points to obtain a license. For the Technician license this would require 38 out of the possible 44 questions, or 86.3% correct to pass. For the General or Amateur Extra, the minimum correct would be 75 out of the possible 88 questions, or

85.2% correct to pass. Both figures indicate that the candidate has a superior knowledge to properly control an amateur station and, though he does not demonstrate any skill with International Morse code, should be eligible for a license.

In the case of a CSCE Element 3 holder, the candidate has two options; he may take the Element 1 portion of the composite examination and add the score of this exam to his allowed 65 points for a total score. Should this candidate fail to obtain the minimum necessary 10 points, he may elect to take the new Element 3 portion of the composite examination and use the sum of the scores on the Element 1 and the Element 3 portions to qualify for a license.

So English Engineers are better than American ones because they don't
have to learn anything but "necessary things".

I can see why you don't like Morse code.

Now ya did it Brian! I will always have a soft spot for slide rules. Of course they are obsolete, but when I got my first slide rule, it took math out of the abstract and put it in the real world for me.

I was in the last class at our school that was trained in their use. I kind of miss the engineer's sixshooter on my belt! ;^)

Where d'ya put the batteries in those things anyhow?

No, just modestly secured. I hae no problem accessing most pages including FCC's.
If someone wants to demand an insecure browser to access their site I'll pass and
just read about it elsewhere. Here, in this case since you've posted it.

Well said! I still have my log tables book (that's logarithms for the young folks). Remarkably useless now-a-days.

I worked in the insurance industry and used to enjoy driving young, visiting actuaries crazy. They would ask a question on the data presented and rather than bang something out on my computer or programmable calculator (both of which I used at all times EXCEPT when a newbie actuary was present), I'd whip out my slapstick. As my eyesight become worse, so did the resulting answers. <grin>

The Armenian judges gave this a 9.8 on the Olympic Troll-O-Meter, but
they were over-ruled by the umpires in instant replay, who award it a
1.4.

The Armenian judges lodged a formal protest!

It was sufficiently trollish, of course, but way too obvious.
It was poorly written, poorly executed, and was so incredibly
lame as to lack the true drawing power of a really masterful
troll.

Maybe as high as a 1.6 for the intense stupidity of the
premise, but a 9.8? Never!

The Armenian judges tear their hair out, throw their balalaikas
down in dismay, and perform the traditional Armenian Dismay Chant!

They demand a recount!

It does. Get over it.

So does lack of a lot of other skills.

> I would think "praticularly for VHF+
> operation" would have been more appropriate for the very reason you
> gave.

That makes no sense at all.

We know you are confused, Brian.
>

All very reasonable, Dennis. The petitioners do not explain how they
derived their data.

Depending on how they traced each licensee, there are many sources of
error. For example, how did they deal with changes in callsign,
address and license class? How did they deal with name changes (many
women change their names when their marital status changes)? How did
they deal with the Tech/Tech plus confusion of the 1991-94 period?
Etc.

This petition needs to be challenged.

I don't do much in the way of Morse CW on the air. Much of the reason for this has been due to some difficulties I have, but enough about that.

As a personal challenge, I've decided to see if I can bring my Morse speed up quite a bit. I started with the ARRL code CD's that I bought a few years back when I wanted to first learn Morse CW.

Would you believe that after two years I still have those CD's memorized? I couldn't believe it - I remembered exactly the letters and words they were using. So in the end, I don't know if I'd recommend the CD's, except to those that have a real quick pickup of Morse, and how do you know that until you try?

So I tried NuMorse. Great program! I've been working with it for a few weeks now, and have gotten my speed up to around ten WPM, 13 on a good day. Soon I'll be ready to *really* do Morse CW. I intend to get up to 20 wpm before I get on the air. just because I expect to slow down under real over the air conditions.

NuMorse sends out pseudo random groups that can't be memorized. It will also make up QSO's or load texfile QSO's that you can load into it. Anyone know of a good source for these?

My only criticism of the program is that the prosigns are a little awkward, requiring use of the shift key which can slow you down a bit.

Still I would rate the program as 9.5 out of 10.

They aren't posting this BS on the Internet (as far as I'm aware).

Anyway, even if this 2.3% retention rate number were somehow
right(which it obviously isn't), they would still be basically
meaningless without comparing similarly derived "retention rates" for
the other 4 or 5 classes of operators.

The research and any conclusions derived from these "isolated No-Code
Technician numbers", are obviously "Junk Science".

That was the beginning of the 'dumbing down' process. We can thank Dick Bash for his books on really tearing a hole in the fabric of the service.

Then when Heathkit folded its tent and went away was the final blow to the golden age of ham radio.

From that point on it has been downhill, more and more bitching and moaning about the code requirement. Making the test easier....more numbers. etc. etc.

What is the answer Jim? Danged if I know. But what I do know is I am going to return to my roots in ham radio. While I can still do so physically, where gentlemen and ladies still exist and where I feel welcome. That place is safe from the infringement of morons and clowns.

And you know where that is.

You are so full of mis-information Brian, have you considered a lobotomy to
remove the tumor?

The wait from taking the test until it came in the mail was 6 to 8 weeks.
That was the 'official' time the FCC gave you when that question was asked.

It sometimes made it in 4. It took mine 6 1/2 weeks.

Thats right, my incentive was in 1961 when my mother paid for my ticket to Pittsburg PA and went along to take my General test.

"We ain't doing this again Danny, you better pass it the first time". I did. At age 14.

Six weeks, not six months.

In the time between passing the test and getting the license, I built
my first transmitter and power supply from junk parts and bought a
crystal for it. Hooked up the TR switch and got everything ready.
Already had the receiver and antenna. When the license arrived I was
ready to go.

Kewl beans, Mike. I too used the ARRL CD's and while they initially
served their purpose, one does tend to memorize the groups. Anytime
you want to subject your ears to some ear-punishing <hihi> slo-code,
drop me an e-mail and we'll set up a sked. Jim, N2EY, and I recently
had a nice CW QSO on 40 and "three land" comes in pretty well here.
Thanks for the recommendation and take care. :-)

We never had courses on either slide rule or log tables "operations".
We had to pick 'em up on the fly on our own. Some of the guys learned
to use 'em in high school. During the first couple weeks of class
there were a lotta guys huddled in groups in the cafeteria trying to
figure the things out. I never did learn to use more than maybe 8-10
of the 21 scales on my bamboo Post. That was a NICE slipstick and I
still have it.

> but when I got my first slide rule, it took

The engineering students' full dress uniform (the physics majors
weren't far behind) also included a pocket protector full of whatever
ya could jam into it, a worn-out rumpled corduroy jacket and a
beat-to-crap briecase . . The uniform definitely differentiated the
engineers from the business administration weenies.

Merge the Novice and Tech Plus classes into a new class and give the
new class the privileges of both. Along with moving what are now the
HF Novice bands down to the XX.025s with a 100-200W max power out.
Wouldn't hurt anything and it might work.

Because, for most people, the speed of 13 WPM meant you could ACTUALLY COPY
Morse Code.

For most folks, up to about 12 WPM you could copy it and NOT actually know
it.

Most countries in the world required 12 WPM. The US Military only wanted 10
Groups per minute. Groups meaning 5 letter 'groups' in a 1 minute period.

That help?

Of course they're posting it. See the link above! Duh?

I'm not defending (or attacking) their research, but given their numbers I'm simply asking the obvious question "What can we do to improve the retention rate?" Even if they're off by a factor of 10 (23% reenlistment rate) we obviously ought to be examing this troubling issue. (Of course, you can opt to blow it all off by labeling it as BS, but that strikes me as a lazy cowards way out.)

With all kind wishes,

> .. --. .... - . .-. ...

As you know from studying for your Technician license (and the material also
appears in the General study guide), you can calculate the length of your

half-wave dipole directly knowing only the frequency. The equation is:

Length in feet = 468 divided by the frequency in megahertz.

Also from these same study guides, you can calculate the wavelength by the following equation.

Wavelength in meters = 300 divided by the frequency in megahertz
(of course if you wish you can then convert the answer to feet).

Comments to the FCC, for one thing. Comments for what we want and against what we don't. On every petition, proposal, RM, NPRM, NOI or whatever alphabet soup comes along. ECFS makes it easy. Maybe we won't win but they will not be able to say there was no opposition.

Setting an example is another. Walk the talk. Build the rigs, put up the antennas, keep the bands hopping. Write articles for QST and other mags. Give talks at ham clubs. Do a station on FD for the local club. Etc.

Thats my point, let the Knuckle Draggers have HF, then they can compete with BPL. I mean lets face it, NCI and the other Morrons claim that all the Tech whizzards are just waiting to get into Ham Radio, so let them deal with BPL.

There's some truth in that. Wasn't there research done on buried
antennas some decades ago? I believe the antennas were encased in
insulation so that there was no direct contact with the soil.

Hi Gang,
If you go back in previous issue(s) of QST (when they were reporting such things) and read excerpts from K1ZZ'ss report to the ARRL BoD on his vision of the future, you will find that what Roger reports should be no surprise, particularly for the CBers, FRS/ GMRSers, SWLers REACTers, etc. I suppose you could frame this as enlarging the tent to get more in the tent or something like that. The Newington crowd has to do this to support those six figure incomes, overseas junkets, expense accounts, etc.

Well, I feel exactly the opposite. To me, FM is boring, but hidden in
all that noise and hissing on HF are the reasons I love ham radio.
Reasons like John, 9M2GV, an expat Brit running a rubber plantation
overlooking the Mallacca Straits. Reasons like Sparky, W3UBM/MM making
the Pacific runs on the rusty old SS Manderson Victory. Reasons
like working K0IR (as VK0IR) on three modes and five bands from
Heard Island, almost at the antipode on the low side of the
freckles-del-Sol. In other words, picking out an almost ghostly
signal from the molecular noise of the universe and finding a
friend, a kindred soul playing exhuberantly in the ether. FM sucks
for all the silence.

YMMV.

So Bob, go ahead and build a "1/4 wave dipole" and tell us how it performs!

"Dipole" *is* defined as half-wave, for within any half-wave segment, there are two (di-) voltage/current poles. You cannot have a "1/4 wave dipole." When that term is used (such as in your Google search), they're really refering to each of the two elements as being 1/4 wave-length each, and 1/4 * 2 = 1/2.

It refers to the number of current or voltage poles, not the number of
elements. Thus, "dipole" automatically refers to "half-wavelength."

You definitely have a point with the exhilaration of a long-distance
contact--especially if they are willing to slow down long enough to get into
a ragchew! But, these days--for someone like me anyway--the "contact" can
be had over the internet. If we're talking pleasure contacts--those where
we take some time to "get to know" someone--internet definitely takes the
upper hand for me. If we're talking necessity radio--that part where
communication necessity comes into play--ham radio has it hands down.

BINGO! . . . they can't be "bothered" . . "Viva le Rubber Duckie!"
BAH!

> FM sucks
> for all the silence.

Creeping phenomenon around here: 2M SSB. Turns out 2M "simplex SSB" is
often beating the area coverages of the machines. Whatta big surprise.
Typical exchange when a machine drops into one of it's BS levels: "OK,
George let's get outta this nonsense, take it 145.XXX." No roger
beeps, no machine politics, no duckie operators, real radio.

The world was blessed with your codeless presence on Nov 11 1957.
Handheld calculators rendered slide rules obsolete when you were
14-15. Are you still using Leydon jars for capacitors Alun?

Can't argue with that. But as Jim points out it doesn't take much of a
radio and antenna to at least listen on HF. What's the show-stopper in
your case?

>I'm not defending (or attacking) their research, but given their
>numbers I'm simply asking the obvious question "What can we do to
>improve the retention rate?"

The first thing is to understand why folks drop out.

If, as some have speculated, a lot of folks became hams 10-12 years ago for honeydo purposes, and now they have cell phones, there's not much we can do.

OTOH, if they're dropping out because of, say, the written tests being too hard, we can petition FCC to fix that.

But first we need to know why. Some will say "the code test" in a knee-jerk reaction - without any proof.

>Even if they're off by a factor of 10
>(23% reenlistment rate) we obviously ought to be examing this
>troubling issue.

You're assuming that there is some credibility in their computations. I say there is none. Suppose they are off by a factor of 40 - the renewal rate then would be 92%.

>(Of course, you can opt to blow it all off by
>labeling it as BS, but that strikes me as a lazy cowards way out.)

Or you can take bad stats as gospel without examining their process.

They claim there were less than 2000 new Techs issued in 5 months. That does not compute at all, given the numbers of new Techs issued over the past 5 years or so (close to 2000 per month).

At the time of restructuring there were something like 200,000 Techs. That was 110 months after the Tech lost its code test, but before any of them expired. Works out to an average of 1800 per month. And the renewal rate is a lot higher than 23% per the AH0A site numbers. AH0A tells how his data is gathered.

It strikes me that calling it "a troubling issue" without knowing how the data was gathered is simply not responsible.

And besides the slide rule, there were various forms of specialized "lightning
calculators". At one time ARRL sold a several different types for solving LC
problems, designing coils, power/resistance, etc. I still have and use one of
the later-model slide rule LC ones for tuned-circuit work. Gives an eagle-eye
view of effects ("if I use a 140 pf variable instad of 100, I'll be able to
reach 2 MHz...").

Hi all,

I'm curious. If I make a mistake during a QSO, what is the correct way
to get back on track. Do I:

1. Send 6 or 7 dits or an extra long dah?
-and-
2. Do I resume at the character or do I repeat the entire word?

Also, I heard a "shave and a haircut, two bits" at the end of a QSO
the other night. When is that appropriate?

Thanks. :-)

So, the 1/2 wave dipoles sold on the same pages are really full wave
dipoles, of are you saying that they use 1/4 and 1/2 wave
interchangeably when talking about the same antennas? Are you
really proposing that manufactuers don't know the difference between
1/4 wave and 1/2 wave dipole?

Or are you simply saying that your mind is so closed to the idea that
people would be making, selling, and buying something that you don't
know about, so it can't really be so?

I think it's the latter. However, since you say that when they talk
about a 1/4 wave antenna that they actually mean a 1/2 wave dipole,
I'm sure that with that very large database, you will have no problems
at all showing me some supporting documentation for your assertion.
Simply saying, "It ain't so." isn't enough.

I've already admitted that my use of 1/4 wave dipole in reference to
HF antennas was in error. Let's see how long it takes the, "there is
no such thing as a 1/4 wave dipole" crowd to admit their mistake.

I find it amazing that I made a mistake in a post about license testing/policy and have admitted my mistake, yet people continue to spam the ng about it.

If you can't accept the fact that people build, sell, and buy 1/4 wave dipoles for use in UHF, get over it. Just don't try to make stuff up and post it.

Jim,

Your point escapes me. (Maybe you're just trolling?)

My enjoyment of amateur radio is independent of the particular mode I
happen to be using at the time, and my quote above is equally true
regardless whether the mode-du-jour is antique or progressive. And, OBTW,
it's called Amateur Radio.

With all kind wishes,

Hans, K0HB

Eight dits is the prosign for "error". I usually go back and repeat the last correctly sent word, and proceed from there. That's mostly a procedural habit from my days as a Navy radioman.

The "shave and a haircut" ending is appropriate any time it feels right to you. Probably wouldn't be appreciated in a DX pileup or on a run-QRG in a contest, but otherwise it's just an informal "parting greeting".

Let's go about my "BS" again. You're the troll. I invite
anyone to look at the lack of civil behaviour extended by
you on a repeated basis in the packet newsgroups. You also
don't know jack about me from QRZ database record as you
would like to purport.

You refuse to listen to others and insult people routinely.
Give it a break.

As usual you try to move away from the real issue. The lack
of ham behaviour and civility on this list.

> If his behavior at the other news group is any guide, he
> will not move on until he has been thoroughly humiliated,

This is laughable. Hate-monger accusing of others of being
childish. Broadcaster, give it a rest.

> Well, I say the sooner it starts, the sooner it will be
> over and we'll be rid of one more troll. Ask the guy about
> my "broadcasting" career... That ought to get him off to a

Well, just refer them to your QRZ post. Since you are very
interested in being part of the PD then you should join them.
Your setup fails to pass 97.113b. We're still waiting for
someone to catch up with you. The section implies for amateur
radio to provide communications at an emergency as a LAST
RESORT. You want to provide news to police departments
via your packet broadcast system on a regular basis. Heck, I
know broadcast in this terminology does not necessarily imply
broadcast. However, your application is a broadcast to the
public. 97.111b6 does not cut dice for you.

Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.policy

The Wise Ones live in the depths of the D, E, and F-Layers, and in the servers at Google.com. They are the descendants of the Gods. I personally subscribe to the theory they are the children of Thor Heyerdahl, the Viking god of Thunder and Balsawood Raft Dxpeditions. But that's another story.

The Wise Ones control everything that happens on the air and on this list, but they can't police every pileup or every newsgroup by themselves, so every morning, just before daylight over Katmandu, the Wise Ones select the "Mostest Intellegentest DXer" in their layer and convey upon him the title INFLICTOR OF HIGHER MORAL HARANGUES. This title and its duties last until the following dawn on Bouvet, if someone is there to observe the sunrise. Otherwise your duties end when WA2MOE gets tired of your crap and sends his lawyers with a gag order.

If you are ever chosen you will know because a representative of the Wise Ones will anoint your temples with oil from a forty year old bottle of Dr. Guano, collected on Ocean Island by VR1L in 1963. For that day you will be known as The Chosen. Your duties will be to seek out those that don't do things the way you do them (in other words, the right way.) When you find them, it will be your duty to correct them.

Think about it...too wide, too weak, too slow, too fast, what's your call dammit, wrong VFO, rotten fist, poor pileup control, wrong band, wrong QSL route, you timed out the repeater, wrong lingo, not enough green stamps, you're in the DX window, no-coders not allowed, coders suck, ... They're all yours.

When you find these wayward ones, you will lumber onto their frequency, stand up in your operating chair and shout, I AM SMARTER THAN YOU, SHUT UP AND LISTEN. You will now have the wayward one's undivided attention. He will think about this very briefly, then yield to your superior intellect. He will be very receptive to your thoughts and point of view.

Lecture him and proceed to the next wrong doer.

Now for the sad part of this tale. There are pretenders and charlatans out there who try to usurp the rightful powers of The Chosen. To you villainous few, I say beware. The Wise Ones also created BAWA (Baddest Ass Whats Around). No matter how bad you are, BAWA has the ability to be badder. You will know when you start your lecture and Bawa yells back, "You're a jerk, but I'm a bigger one. LET'S ESCALATE".

And you will have no choice.

But soon BAWA will tire of you and sink your little balsa boat. As you slip under the surface you will yell, "BUT I WAS RIGHT, DAMMIT" and you will once again prove the ancient mariners axiom -- AN OPEN MOUTH TAKES ON WATER.

>> Also, I heard a "shave and a haircut, two bits" at the end of a QSO
> > the other night. When is that appropriate ??

Military Ops of yore wud use this at signoff -- a cutie type of thing.
Some Hams use it at the sign off -- one op sending all but dit dit, the
other finishing it.
Some shorten it up with just dit dit. Both sending.

Also military phone ops wud press PTT twice quickly (no voice) as a signoff.
Double clutch -- woosh woosh. A few Hams do this, leaving newbies scratching
their head.

Not good Mil practice - but we did it any way, probably confused the
enemy -- hi hi. Perhaps some code buster spending months trying to figure
out what was "shave and a haircut, two bits"

The 8 dits is an error character, then resume with the goofed up word, for
more characters common and obscure -- see URL:
http://ac6v.com/morseaids.htm#INT

I did the same search. You don't get anywhere as many hits (104) when searching on 1/4 wave dipole. Interestingly enough, you get some where people are asking if a poster *really* meant 1/2 wave dipole. If you just type in 1/4 wave dipole, you'll get hits on 1/4 1/4 wave. 1/4 wave dipole, wave, and dipole. I don't doubt that you could get around 39,000 hits with that broad a search.

At best, it is a misnomer, at worst, a pretty poor antenna.

Jeffrey, the answer is "thousands, and growing every day."

It's too bad that a person that refuses to give out even the basic numbers of devotees decides to ask for a numerical breakdown of a rival groups numbers.

Assuming his accounting methods are acceptable, the answer is thousands, and growing every day.

Yep, it was reported as a part of "long range planning by the BOD" or some such.

My mileage does not vary in the least, Hans. And this is a large part of what separates the.....

Oh well, probably enough has already been written on the subject.

BTW, I think the last time I turned on my linear amp was when I worked that etherial signal from the other side of the planet, VK0IR, on a near-dead 20 meter CW band. Their response to my 100 watt calls was "didi dum dum didi", and "QRZ?"

Running 1400 watts out, the recognition was immediate.

Real rational-sounding guy, huh? He just naturally assumes that everybody here shares his mental problems and has studiously followed all his past rants on other newsgroups.

I think they call his condition - "meglomania" ?

William refers to an article describing how non-hams can monitor ham radio transmissions in order to obtain info during an emergency. His claims are ridiculous of course, particularly his assertion that it is illegal for non-hams to monitor ham radio transmissions, but if you would like to look at what he's ranting about and judge for yourself, go to the "Library" page at USPN http://www.uspacket.net and read the article: "Emergency Digital Communications - Another Angle".

No, I didn't bring William in here as a "ringer" to give me an excuse to mention USPN, or the articles there. Though is true that he has worked over the last year to help publicize USPN, he has done so on his own, with no expectation of compensation (real or implied) from USPN for his efforts.

So though William may be a few bricks short of a full load, he has not let his disability keep him from making a contribution in his own special way. For that, he has the thanks and appreciation of the folks at USPN. It is this spirit of volunteerism and mutual support that makes the hobby great.

> Wouldn't hurt anything and it might work.

Sounds good but doesn't go far enough.

How about this:

1) Three classes of license: Basic, Intermediate, Full (change the
names if you don't like them - Third, Second, First, Novice,
General, Extra, whatever)

2) HF/MF bands split into subbands by mode and split again by license class. Some bands may be split by mode only. Bottom of each band is CW only, middle is CW/digital, top is phone/image. Percentage division about 20%/30%/50% (varies with band). "Digital" includes digital voice modes if bandwidth under 1 kHz.

3) "Basic" license test is simple 20-25 question exam on regs, procedures, and safety. Very little technical and RF exposure stuff. Main objective is to keep Basics out of trouble. Basics get 200-50 watts on HF/MF and 25 watts or so on VHF/UHF (power level is below the point where RF exposure evaluation required). Modes are CW, analog voice, PSK31, RTTY and many of the other common data modes like packet. Basics cannot be VEs, control ops for repeaters, or club trustees. Basics get most VHF/UHF and about half of HF/MF spectrum, including parts of all subbands-by-mode. Basic is meant as the entry level. Easy to get, lots of privs, yet there's still a reason to upgrade.

4) "Intermediate" license test is more complex 50-60 question exam on regs, procedures, safety and technical stuff. Intermediates get 300-400 watts on all bands, all modes. Intermediates can be VEs after qualification (see below), control ops for repeaters, and club trustees. Intermediates get all VHF/UHF and about three quarters (or more) of HF/MF spectrum. Intermediate requires at least one year experience as a Basic.

5) "Full" license test is quite complex 100-120 question exam on regs, procedures, safety and technical stuff. Mostly technical, with some regs to cover expanded privs. Fulls get all privileges, modes, bands, etc. except that Fulls can be VEs only after qualification (see below). Full license requires at least one year as an Intermediate.

6) All licenses are 10 year and fully renewable/modifiable. No age requirements or limits.

7) Basics have six-character calls, Intermediates have five- or six-character calls, and Fulls have four-, five-, or six-character calls. Nobody has to give up an existing callsign.

8) Separate 30-35 question test for VE qualification, open to Intermediates and Fulls, which allows them to be VEs. Existing VEs are grandfathered.

9) Existing Novices, Techs and Tech Pluses become Basics, existing Generals and Advanceds become Intermediates, and existing Extras become Fulls. Existing hams can continue to use their current privileges as long as they retain license documents showing their old license class.

10) Experience requirement is not waived for existing hams to upgrade, but their time in existing classes counts.

End result is a system that is easy to get into (Basic is envisioned as a 21st century version of the Novice) and has reasonable but meaningful steps to reach full privileges. Testing matches the privs granted. Power levels are set about one S-unit apart. Nobody loses any privileges. There are only three license classes and four written tests, so FCC doesn't have more work.

Example of new privileges:

80/75 meters
3500-3575 CW only
3575-3750 CW/data
3750-4000 CW/analog phone/image

Basic: 3525-3625 and 3900-4000
Intermediate: 3525-3750 and 3850-4000
Full: entire band

Heck yes. In fact it went something like this:

First, ya had to have a General or Advanced for at least two years
before they'd even let ya try the Extra.

Then ya had to pass the receive test with at least 100 correct
consecutive legible characters. No going back and fixing things after
the code stopped, either, after the last dit it was PENCILS DOWN or ya
flunked right there.

If ya passed the receive, they let ya try sending with their straight
key or *your* speed key. You sent until the examiner was satisfied.

Only then did they let you try the written. Mess up at any point -
even one character or question - and it was "go home and study some
more and don't come back for at least 30 days". No CSCE, no partial
credit, nada, do it all first try at one sitting or it doesn't count
at all.

How is it dead? The FCC has not changed the rules. And until they do.
Morse code is still a requirement for ARS operation on HF.

I like it Jim. I suggested to FCC years ago to go with a 3 tier license structure. My major difference was to make the diverse modes a 'add on' to the license. Instead of power restrictions.

Would be a lot easier to regulate that way. Having to test for a 'add on endorsement' would still maintain the technical aspects of the ARS. And provide a way of continued learning.

Just a thought.

Against my better judgement, I'll communicate with you.

Re-read my post.

Explain how a search engine works.

Explain how I can get 104 hits vs your 39,000.

Explain how you can get 39,000 hits. I got 24,500 hits when I did it
your way, but those numbers can change.

Think about how being specific in search params will give you more
relevent results than just typing in the words, which will give you many
many hits on sometimes only one of the words.

Oh I forgot, you don't have to explain. But that won't make you correct,
either.

That's Jim;s OPINION, Brain. Other than that, you have not
satisfied the question of how the ARRL has allegedly pushed for "lower
standards".

Bert,
Please pose this and all related CW questions to NCI
Inc.&#65533; The National Code Institute.

Capt. Carl or one of his minions will happily answer all your Morse Code
questions.

10-73's!

Can't. I've had Morse whether I liked it or not.

> So does lack of a lot of other skills.

What skills do you lack?

> > I would think "praticularly for VHF+
> > operation" would have been more appropriate for the very reason you
> > gave.
>
> That makes no sense at all.

Since everyone presently on HF had to go thru the Morse hoop, and
those on VHF+ didn't necessarily have to do it...

> We know you are confused, Brian.

Too bad things must be explained to you in the minutest of detail.

> > Duh!!! again.
>
> Exactly. You keep proving my point for me. Thanks.

So what do you lack to be a fully qualified radio amateur,
particularly for HF/MF amateur operation?

I no longer keep QST beyond the past year or so, therefore I no longer have the issue where he broached the subject in his monthly "It seems to us" column. But it sure was there some time back, a year and a half or two years ago, maybe a little longer. Look through your old QSTs and you'll find it.

I think he was testing the waters,and I should not be surprised if he found them uncomfortably warm!

Dick

That's all well and good James and I'd support your basics but what
you're suggesting is a radical, complete top-to-bottom restructuring.
Much more so than any we've seen in the past seventy-some years.
Versus some Band-Aids on what already exists. With the FCC we have
today we'd be lucky to get even a Band-Aid or two let alone a complete
rework of HF ham radio. We're allowed to dream but then comes cold
hard reality.

That's the modern ARRL plan Dan. Fight the threats from without, while the Service rots from within. Let the service rot if it means raking in a few more dollars. Pretty soon there won't be anything good left in the service worth protecting. That would be like spending money to preserve what the CB service is today.

That's about right on the dates, except that there were very few calculators around back then. I remember my dad paying the equivalent of about $250 for a rather large four-function calculator c1970-1971 ish. It was made by Sharp. Sinclair had a cheaper one, but you had to build it from a kit!

Also, high school (at least it's sometimes called that, amongst other things) is usually age 11-18 in the UK, so it takes in middle school/junior high (although in some areas of the UK there are middle schools, just to confuse the issue).

I don't work CW, but if you took the trouble to look up my date of birth, then you know I passed a code test. One thing you can't get from a database is the date I was first licenced, which is February 29th, 1980 - as a no-coder, of course!

Click on the link. I did and here is what I got...BTW, this is copy
and paste, so it's exactly what's there.

Searched the web for 1/4 wave dipole. Results 1 - 10 of about
38,900. Search took 0.20 seconds

Someone is lying and anyone who wants to click on the link can tell
who. BTW, I found five sites that list 1/4 wave dipoles and one site
that lists a 3/4 wave dipole in the first ten listed.
>
>Think about how being specific in search params will give you more

No, since I'm already correct and have documented it, there is no need
for me to prove anything. You know, I have better things to do right
now than to click on a link that I've already provided to show that it
says the same thing that it said when I posted it.

Plonk for now. I may take you back out when I get caught up on
things, but I really don' have time to deal with liars right now.

Just out of curiosity, Dan - where were you living in '61 that made Pittsburgh the nearest FCC office?

>"We ain't doing this again Danny, you better pass it the first time". I >did. At age 14.

I had it easier 'cause I was just a subway ride from the Philly FCC office. Short walk at each end and a pair of PTC tokens for the trip. Parental units were *not* involved. Tech and Advanced in '68 at 14 and Extra two years later.

You'll like this bit:

The way they ran the Philly exams was that they did the code first and then the writtens. And they started with 20 wpm. Better be there on time or you missed it.

So the day I'm there for the big E, the examiner comes out right at 8 AM and asks the assembled multitude if anybody is taking 20 wpm code. Turns out I'm not only the youngest one there but I'm the only one trying for Extra.

Examiner and I go in the exam room, he sets up the code machine, phones, pad and pencil, etc. You know the drill. Says all I need is one minute solid out of five. I put on the cans and he starts the machine. I have no trouble copying, so he comes around and looks obver my shoulder while I write in block letters. I figure I've got it licked, right?

After about 90 seconds he turns off the code machine. Uh-oh, I think, something's not right, I've never heard of a test being interrupted like that.

"Pretty easy, huh, kid?"
"Uh, yeah, I guess".
"It should be - that was 13. Here's 20"

And he changed drive spindles and the real test began.

I'll never know if he just forgot to change speeds, if he wanted to make sure I could do 13 first, or if he wanted to rattle the kid's cage a bit. Didn't matter, I passed.

Then 20 per with a straight key until he said "OK, kid".

You've been there, Dan, you're just 7 years ahead of me.

Perhaps if Mr. Brock does have me killfiled, someone could explain to him that if he wants to find relevant hits on 1/4 wave dipole, he can just put the words in quote marks on Yahoo or Google.

Then the search will return relevant hits, rather than simple occurrences of the individual words, along with the hits wanted. There is no doubt in my mind that he got those 39,500 hits. It is symptomatic of poor database searching technique.

His 39,500 hit number, for all it's sound and fury, signifies nothing.

Then please tell him I will be happy to be filtered from his mail forever if possible.

I never hear people complain about:
1. The amount of junk food other hams eat
2. Smokers at hamfests

Junk food is a staple at club meetings and Field Day. At my club's meetings, you can always find plenty of salty potato chips (not the low-salt Pringles Right Crisps), coffee cake, glazed muffins, sweet rolls, and other unhealthy food. There is always plenty of soda pop to drink. True, apple pie snacks and cookies are junk food too, but at least they taste good. Kentucky Fried Chicken and donuts are served at each of our annual Field Day weekends.

I am the only ham radio operator who complains that other hams eat too much junk food. As a Morse Code testing opponent, I hate to say this, but junk food seems to be an EVEN MORE sacred tradition than Morse Code tests. The trend has been towards reducing Morse Code testing requirements, but I see no sign that the junk food tradition is ready to head off into the sunset.

People complain about hams with body odor at hamfests, but I can't remember reading anyone complaining about smokers at hamfests. I don't notice people's body odor - I don't run around sniffing everybody. But the foul tobacco smoke spreads like wildfire. I don't think body odor can spread 10-20 feet away very easily.

Hmmm, I see a great idea for a compromise on the Morse Code testing issue. The anti-Morse-testing side complains that the Morse Code test is unnecessary. The pro-Morse-testing side complains that removing the Morse Code test will make it too easy for people to become licensed. I propose that we replace the Morse Code test with health requirements. The replacement license requirements will be:
1. Your Body Mass Index (http://nhlbisupport.com/bmi/bmicalc.htm) must be below 19. Of course, if I gain 5 pounds this fall and winter, I'll have to revise the cutoff upward to 20.
2. No smokers may earn ham radio licenses.
3. No club is allowed to serve soda pop, donuts, glazed muffins, or potato chips with more than 135mg of sodium per serving.
4. At all club Field Day events, vegetables must be served for dinner.

Hey, these requirements would make it nice and challenging for people to earn their licenses. We want our hams to be healthy. Too many are afflicted with obesity, heart disease, high cholesterol, high blood pressure, and other health problems. We won't give licenses away - hams will need to cut the fast food, junk food, and tobacco out of their lives. This will be quite a challenge given how sacred the

Kentucky Fried Chicken, soda pop, and donuts are.

As one PP'er to another, it is an honor to know you! It's nice to know that
we're morally and intellectually superior to the dumbed-down, unwashed,
non-PP'ing hoardes of inferior drivers.

Michigan still has "Chauffeur's" licenses? Which class of CDL is that
equivalent to? Here in Delaware, I'm told that Emergency Vehicle
operators don't require anything more than a standard Class D Driver's
license. They do, however, have to be a card-carrying member of
the "Emergency Service" (usually a local volunteer FD) to which
the emergency vehicle is registered.

Again, by definition "dipole" means two current or voltage poles; it
does not refer to the number of elements of the antenna.

You can't have two (di-) current or voltage poles in just a 1/4-wave
segment. Calling it such doesn't make it so. It takes a 1/2-wavelength
for two (di-) such poles to appear.

> -and-

Bert:

The actual prosign for an error is eight dits. I've heard hams using a straight key or "bug" send a long dash, but that's normally an alternative form of "zero" and not an "error" prosign. BTW, another alternative form of "zero" is the letter "O" (three dahs).

>2. Do I resume at the character or do I repeat the entire word?

It would be better to repeat the word; the OM on the other end will most likely figure out what you're doing in any case.

>Also, I heard a "shave and a haircut, two bits" at the end of a QSO
>the other night. When is that appropriate?

At the end of the QSO. It is a traditional ending, especially if you happen to have long hair and a 3-day growth of beard.

The basic four-function handheld calculator was still about $600
when he was 17; at least that's what we were selling them for at
RS at that time.

I was still using a slide rule in my 1980 college physics class.

What's really scary, Mike, is that folks like Bob believe everything
they read on the web. A manufacturer might advertise a misnomer such
as "1/4-wave dipole" and someone like Bob believes such an item can
really exist, when in fact "1/4-wave" and "dipole" are contradictions.

Assuming that your post is serious and not intended to be humerous, Jason, I'd say that you should be careful not to neglect your mental hygene. Eating right and staying away from tobacco is nice, but it won't ultimately do you any good if your thinking is toxic.

I don't smoke, but I would gladly take up smoking as an alternative to becoming another miserable, obnoxious member of the PC-police.

There's probably only one hope for you now, Jason, and that is to buy yourself a pack of Chesterfields or Luckies and fire one on up on your way to "Golden Corral" to take advantage of that all-you-can-eat buffet.

"Smoking section, please!"

What is the justification for sharply cutting back on existing Tech and Tech Plus privileges? We can presently use up to 1500 watts on VHF/UHF. You suggest a 25 watt limit. We can currently be repeater control ops. You suggest we shouldn't. We currently have no limits on operating modes. You propose limits. Since there have been no serious problems reported in any of these areas, I don't see a justification for any of these changes.

> Communications - Another Angle".

The post on QRZ is long gone, but was a direct copy of the article mentioned
above. I cut 'n pasted it to QRZ, several months back.

Since putting the info here about the article at USPN, not a single ham has
mentioned anything about taking a look at it. Apparently nobody here gives a
hoot about William's ranting and foaming at the mouth, having spotted him as
a troll.

Can't say I'm surprised about that... I don't give a hoot about it either.

That makes it unanimous I suppose, with William being the sole exception.

Having failed even as a Troll, I wonder what worlds William will be out to
conquer next? Whatever it is, I wish him more success than he has found
here.

Well, that's why it's called Rip-off Shack. I had a couple of TI scientific calculators when I was in college. The first one I unfortunately lost (actually dropped from a motorcycle at 70-80 mph!), but I still have the latter, although it hasn't been possible to replace the battery pack for years, so it can't really be used.

I don't think either of these cost more than about $ 125 at most, and my father bought a four-function Sharp for about $ 250 when I was about 13, i.e. about 1970ish. In fact he replaced the Sharp with a CBM costing maybe $ 75 when I was about 15 or so. Surely these couldn't have cost more in the US, especially not the ones made by Texas Instruments?

If you sold a 4-function machine in Rip-off Shack for $ 600, surely that can't have been when I was 17, i.e. 1974/5? That can't be right. In fact that would have been when I got my first TI scientific, at 17, for a fraction of that price. By 1980 I was on my second scientific calculator.

You must have replied to the wrong post. But out of curiousity, how
many current or voltage poles is a "J" as in J-pole.

When about 10-15,000 of them get together and do it, it does give it
some creedence.

What I find really ironic is that, instead of simply providing
adefinition, someone would dance all around it and tell lies. Here,
let me do your homework for you...

http://rhyme.lycos.com/r/d?u=dipole_antenna

http://dict.die.net/dipole%20antenna/

http://www.hyperdictionary.com/dictionary/dipole+antenna

There, do you feel better now??? The way the discussions go is that
if you make an assertion, it's up to you to support it. I'm getting
damn sick and tired of having to do you guys homework for you.

>

I graduated from college in 1973. Only ONE student in the entire engineering department at the university owned a calculator at that time. Naturally many of us checked into buying one but since it cost $325 to purchase one with adequate engineering/scientific functions (a Hewitt-Packard), none of the rest of us did. That was a huge chunk of change back then. By comparison, a slide rule was approximately $30. The following year, one could by a Texas Instruments with all the functions for a "mere" $125. So I got one for work. By the way, some companies started providing calculators for employees at this time but you wouldn't believe the paperwork you had to fill out. Plus you had to have a docking station with a lock at your desk so it didn't "walk off". Prices dropped relatively quickly over the next several years. When they got close to the cost of a slide rule, calculators finally displaced slide rules.

Just to put those numbers in perspective, I'll list some other things that I remember from 1973-1974. An engineer who had just graduated with a Bachelor's degree from college was getting about $10,000 to $11,000 per year. A nice 1200 sq ft house with full basement and decent sized yard could be purchased in the suburbs around Seattle for under $30,000 and the monthly payment was under $300 per month.

So you can see that a calculator in 1973 and before was more than a week's wage for a working, professional engineer. It was out of the question for most students.

You are not unusual in being ready to go when the license finally came.

Sorry, meant weeks. Mine came in 8 or 9 (weeks). I think the VE
might have held on to it until the Novice class ended. I graduated
ahead of the class.

i hate to break this to you jason, but these vices are not just limited to hams... may i suggest you join a health club, or maybe the sierra club, or some local vegan support group to find others of like feelings... if you insist on going to club meetings and hamfests with feelings like this all you will do is frustrate yourself and annoy others that you try to change.

The Morse Exam is symbolic of only the Morse Code. The VECs threw
that out the window when they subbed a Farnsworth Exam at 13-15WPM for
Morse at 5WPM as specified by the FCC in PArt 97.

OK, really. I don't know if you guys are trolling and can't even tell which one of you (not just you two, but Dick, et al). IF there is no 1/4 wave dipole, and IF they aren't effective as an antenna--if there are 1/4 wave--then, why the following:

From http://www.qsl.net/wd4bis/Newham/nhp2.html
. . ."When gain figures are listed as dBd, they are using a 1/4 wave dipole cut for the center frequency of the band of interest as the reference.". . .

From
http://www.wr6wr.com/newSite/articles/features/olderfeatures/antennaswithtwist.html
. . ."The shortest self-resonant linear length of wire is not the half-wave dipole as one might mistakenly assume, but instead, a wire one quarter of a wavelength long." and . . ."On-the-air tests on 2 Meters with KI6O indicated that the transmitted signal strengths of the short dipole were equal to or better than the full half-wave antenna. Because the "on-the-air" tests were crude at best, I don't make the claim that the short antenna had any gain, but in any case, it was no worse than the full-size antenna.". . . and "The 1/4 wavelength 40-meter dipole antenna would normally have a

radiation resistance of about 14 Ohms. The radiation resistance of the short 40-meter dipole was increased to 50 Ohms by the use of the spiral coils and resulted in a much better match to the 50-ohm transmission line.". . . (The last being proof that experimentation and innovation can overcome any impedance mismatches when dealing with the volatile 1/4 wavelength arithmetic). Uh oh...now Dick's gonna find out that....oh, never mind, it'll go right over his head.

From http://www.oakvilleamateurs.net/newsletters/hb200302.pdf
. . ."For most 40-meters, the most practical antenna is the 1/4-wave dipole (66 feet in total length) up at least 33 feet in the air. If you've never worked (or heard) Europe on 40, it's likely your dipole is too low. The challenge grows on 80 where your quarter wave dipole (133' 9") needs to be up at least 66 feet.". . . Oh, for Dick's sake, I'll let him explain why the distances from the radiation plane of the antenna to the ground level are important when working with 1/4 wavelength antenna designs. OH, dang it, now he's going to know...oh, never mind, that'll go right up over his head, too!

The above is from a search using the boolean combination of "1/4;wave;dipole and antenna" with a result of 12 hits from Altavista, my search engine of choice.

Now, this dialogue that's been occurring on this topic is misleading at best, and shameful at worst. Dick jumped on the bandwagon of someone else (like he always does because he can't think for himself) that he *thought* knew what they were talking about--when, in actuality that person was trolling for the general knowledge of all participants in the discussion. So, you've all been "snookered" and the previous thread under which this topic was flowing, "FISTS petition to the FCC" is the best damned example of a total mess as I've ever seen.

Kim W5TIT -- done with the topic, but changed to an appropriately titled topic. After all, we wouldn't want a search on "1/4 wave dipole" to miss all this pertinent, scientific discussion. *yeah, right*

This is the part where Rev. Jim comes in and puts in an apostrophe to
show posession, and a period to show closure.

But that might cause a rift in the PCT Agenda, so Bruce gets a pass.
Again.

What a nonsense generalization. As though the rest of society doesn't eat junk food or smoke or are affected by obesity, heart disease, high cholesterol, high blood pressure, and other health problems.

One study showed with a population sample of six million, one million will have high blood
pressure and not know it!

Another study shows more than 30 percent of American adults, were obese.

I went to a gathering of lawyers the other day -- and so help me they were all fat, smoked like a chimney and eat the catered junk food like it was going out of style -- therefore all lawyers are fat and smoke etc.
Give me a break oh generalized one.

I forgot about those, they were really slick. I had an L/C version.
Went the way of the 75A4.

I have a current-tech version. I originally bought Mathcad for doing
biz-type engineeing number crunching but at this point I've written
and canned more ham related math routines than I have for biz
purposes. One of 'em is an L/C cruncher which is pretty simple. I also
wrote a coil designer which is *not* simple. Net result is that I can
bring both up in separate windows and copy-paste results between 'em
and bingo, almost instant tank circuit designs right down to the
number of turns of #X wire x Y form diameter x Z winding length. To
the fifth decimal place when I get really anal.

>Tech Plus privileges?

You snipped the second sentence of 9), Dwight. Here it is again:

9) Existing Novices, Techs and Tech Pluses become Basics,
existing Generals and Advanceds become Intermediates, and
existing Extras become Fulls. Existing hams can continue to
use their current privileges as long as they retain license
documents showing their old license class.

"Existing hams can continue to use their current privileges as long as they retain license documents showing their old license class."

Just like Tech Pluses who have been renewed as Techs can still use HF, and anybody with an old Novice or code-tested-Tech license document gets Element 1 credit. If FCC accepts the idea for those uses, why not for the above?

IOW, no existing ham loses any privileges.

I graduated EE school in 1976 and those numbers are right in line with my experience (1976 numbers about 15% higher due to inflation).

Some other datapoints:

- New car prices ranged from $3000 to $5000
- Gasoline was about 60 cents a gallon
- A year's tuition at an Ivy League university was $4500
- Ham rig prices were somewhat less than today's prices Maybe 60-75%.
- Inflation was double digit and interest rates were not far behind

Yeah, absolutely. They'll say "we've already put enough work into
diddling with this stuff in the past few years, come back in 5-10

years when we have a better picture of the effects of what we've already done become apparent". Which is typical FCC behavior when it comes to major restructurings going back decades.

It's not worth the time and effort to reform them.
I say let the ignorant goofballs smoke away with
their tobacco and eat their horrid fast food. This way they die
faster and sooner, then you can go pick up their radio estate
gear on the cheap from their XYL, who in all likelyhood
has been secretly wanting to clean out all her husband's
hated "ham radio junk" from out of the house for years.
(I've managed to get hold of 5 HF stations this way over
the past 3 Years)

Once I even scored a complete IC-706 and TS-50 station for
$275.00 "cash-and-carry". The ham's wife hated that
radio crap so much she was glad to see it go and did not
want to deal with it. (she was ready to shitcan all of her OM's
gear, I caught her in time at a yard sale before she sold the
house and moved to Fla. - woooo hoooo!)

My first son was born in October 1974. The following year, 1975, I can't remember the exact figure but my then-husband made right at or a little under $3,000.00 and I think the only "assistance" (welfare) we were on then was for Medicaid. I don't remember ever doing food stamps, cash, or anything like that. But, I think I remember when I found out I was pregnant, we immediately went to Social Services to see what we could do about Health Insurance.

Anyway, so health issues aside (and other than pregnancy neither of us ever went to the doctor), we, uh, well, subsisted on that income. Heh heh, we sure didn't "live" on it, but we weren't in need; we had food on the table, gas for the car to go to work, and rented an actual house. Granted, we went without cooking gas all Summer (we cooked on a grill outside or ate a lot of sandwiches), so we could save up for heating oil through the Winter. The house rent, if I remember correctly, was $75.00/month. Two-story, 2-bdrm, 1 bath, kitchen, living and dining. Huge lot (I grew and froze all our veggies in a 32' x 32' garden--with NO motorized tools mind ya), we had a

deer every Winter that I'd make stretch for meats (mostly ground to make it last), and my husband ate fish (trout right out of the Battenkill River). Yuk, I didn't like fish.

Gasoline for the auto, what was it? $0.28 or something near there? Gosh, I can't remember all those prices. Baby food was, I think, $0.19 a jar and--oh, disposable diapers were just coming onto the market and I sure as all get-out didn't have money for them. LOL I went the cloth diaper route, in fact I can't think of any of my friends using the disposable, except for whatever ones they got in baby showers and, when those were gone, that was it.

Anyway, life may have seemed simpler then, and maybe it was to some degree. But, I'll take life today much quicker! I could not be shopping for a 2300 sq. ft. home back then!!

Sure they were out there in that timeframe. I forget exactly what year
it was, maybe '71, when I paid $200 for a four-function Japanese-made
Canon calculator. Beautifully finished, solid as a rock. They were
sold by Canon itinerent peddlers who went out knocking on the doors of
tech-based companies which is how I got mine. I happen to prefer HP
RPN calculators which are no longer available in stores. My 1983 HP
32S died about three years ago but HP still sells the things direct.
It's a cult calculator and HP supports the cult. Odd . . !

> schools, just to confuse the issue).

It's all the same ball of wax. The regime I plodded thru was into
first grade at five, into junior high school for seventh grade, then
into high school for tenth thru twelfth grades, pop out at 17-18.

I guess the "PC police" are more evil than Phillip Morris, whose
products kill millions around the world every year. Wouldn't you
rather rebel against Phillip Morris? They represent everything you
hate about the Establishment!

> There's probably only one hope for you now, Jason, and that is to buy
> yourself a pack of Chesterfields or Luckies and fire one on up on your way
> to "Golden Corral" to take advantage of that all-you-can-eat buffet.

Smoking is so disgusting that I wouldn't even do it if it were
healthy.

If it's any consolation to you, the Atkins diet followers think I
guzzle carbs the way a 1972 Cadillac guzzles fuel. (According to news
articles, these people now have their own grocery stores and
restaurants. Ugh.) The anti-meat anti-fat Ornish diet followers
think I guzzle fat the way a 1972 Cadillac guzzles fuel.

I guess I must be eating right if other hams think I'm on a crash diet
and the followers of the latest diet fads think I eat like a hog.

Nope. The tobacco companies are great benefactors of mankind, compared to the PC police... Tobacco may poison individuals, but "PC" poisons entire cultures, causing much more damage and expense than all of the tobacco companies combined.

One quick example: Irrationally afraid of nuclear power, the "PC police" has seen to it that we stick with the burning of fossil fuels for our electricity. How clever.

The main problem with "PC" is not to be found in individual examples of PC actions though, but rather in the pervasive stupidity it imposes upon the entire culture. It is basically an instrumnent of deconstructionists who insist that there is no truth, there is no history, so its "OK" to lie as long as its allegedly for somebody else's "good".

"PC" sees it's fullest expression in California, the cereal-bowl state.

(Once you get past the fruits and nuts, the only thing left are the flakes.)

"(MY)" answer, Brain?

I'm not the one with a question. I am satisfied with the
League's performance, considering they charge the same amount for
their services for other like-organizations (ie: AOPA).

In MY opinion the League has continued to provide what I would
expect from it. The only thing it can "absolutely" promise is to do
it's best to represent it's membership...NOT an easy thing to do in an
organization with fluid demographics and preceived needs.

The perception of shortcomings was from others. Address the
"question" issue to them.

Steve, K4YZ

W1AW also sends Morse Code practice on VHF, if you live close enough.
But I don't think 8-land is close enough.

If not, Jim can tell you how to build an Elecraft K1 out of junk box
parts, or something like that.

I just a bit upset that this person claiming that the cb culture is ruining the hobby. He is creating an artificial crisis and a highly absurd cause for this "crisis". He claims this (made up) crisis is a result of lowering the code speed requirement

Even then, his only evidence (which he also made up) is hearing cb handles and 10 codes and this is proof that the hobby is going bad.

The ARRL has a destructive agenda. If they cared about amateur radio as much as for the amount of money their bank account, they would have said something at the last world conference. It's all lip service and lies to try and get hams like me to hold our piece and hope we don't feel like we're being lied to again.

Since then the same question has been posed many times, but there's never a straight answer. Last time it was asked, Carl claimed that he could not tell us because the membership list was confidential, and they would not give out names or calls. How that prevented giving a membership total was not explained.

One indicator of NCI membership is to look for the highest NCI member number, then subtract 1000 (because they started with #1001, not #0001. Guess why?)

The highest number I've ever seen was 47xx, so there are maybe 4000 members. Or rather there were ~4000 members in the history of the org, because numbers are not reused, there are no dues and membership never expires.

My guess is that there are maybe 3000 US hams who are active NCI members. That's less than .44%

No, Vince, I believe you're way off base here. ARRL has a real problem-It wants to do what is best for ham radio, and divining what that is is not a simple chore, by any means. Then you have the other facets of the problem, which include but certainly are not limited to, the vast array of opinions among hams, members and otherwise, then there's the FCC and their own budget constraints, etc, etc etc.

But NO, you'll never get me to believe that ARRL as an organization has anything but the best interests of ham radio at heart. I do believe that at times they get a little off course, but they seem to manage to make the necessary corrections.

Dick

Quite frankly, Charles, I'd love to see all of the smokers suddenly stop. Really. Then everyone would find out what this is *really* all about. It's about money. You can't cut income taxes the way the government has without reducing spending - and they found a way to grab more money from the 25% of the adult population that smokes - and make it politically 'correct' as well! Our county found a way to sell that "future" tobacco income and raise a ton of money. Guess what? They spent it. Now Monroe County is facing some nasty decisions. New York state now charges $1.50 or $1.55 per pack plus 8.25% sales tax on that tax (at least here in Monroe County). I see a sign at the local grocery store - over $50.00 per carton plus 8.25% sales tax. Was it Alabama that rejected property tax hikes to support schools? What is happening is the elimination of support for necessary items (schools do come to mind). Unemployment has new wrinkles designed to keep folks from collecting even if they were laid off for business reasons. Yes, they now will pay for college education if you can't find a job after a year; unfortunately, there has been no funding for that since 2001! If you work for a company with a company paid pension and you are eligible to collect it, they will reduce unemployment by that amount - even if you aren't collecting it! Lovely.

I was very fortunate in that I found another job within the company I work for. They have hollowed out the pension system and use the savings to hire new top managers (the new president only had to show up for work. He could quit or be fired the same day and would receive $175,000 per year for life. If he stays 9 years, he gets $1,000,000 per year for life.).

Interestingly, a new store was built about 5 blocks from me. I tried it and was amazed. The groceries are the same quality as I'm used to and are far cheaper. 3 *large* reinforced shopping bags (one of which was so heavy it was cutting into my hand) cost me $38.20. Hmmm ... I wonder how the main store (Wegman's) is going to fair when folks discover this? So, Sam's club for meat and this other store for everything else as far as I'm concerned.

Back to the smoking. I really wish everyone could stop smoking. You think Social Security is in a mess (you are aware that the feds have "borrowed" those funds?) now, just wait until 25% of the population starts living an extra 5 to 10 years! Many folks (non-smokers as well) live their final few years in a nursing home. The big difference in costs between smokers and non-smokers is the 5 or 10 years of Social Security that the non-smokers collect. Even a modest check of $1200 per month is $14,000 per year. That comes to $140,000 for an extra 10 years.

Maybe we should pay the ball players $100,000,000 per year instead of only $10,000,000. That should fix things just fine. At least their kids will get a decent education.

>pressure, and other health problems.

Take all that away, and what will they talk about on 75 meters? ;-)

>We won't give licenses away -
>hams will need to cut the fast food, junk food, and tobacco out of
>their lives. This will be quite a challenge given how sacred the
>Kentucky Fried Chicken, soda pop, and donuts are.

I dunno if you're serious, trolling, or satirical, but it's funny any of those ways!

Seriously, though, it's not just a ham radio problem - it's an American problem. Just look around you. Combine an aging population, cheap sugary/fatty foods, sedentary but high-stress living, and a drop in other vices like smoking, and you have a recipe (pun intended) for folks getting heavier.

I'm 6' 3" and my target weight is 180. I'll let ya know when I get there.

First job outa school paid just under $13K, I thought I'd gone to
heaven. Then I moved to New York State, where they sell beer and wine
in the supermarkets and I KNEW I'd gone to heaven...

I don't know if folks in that situation would qualify for Medicaid
today. Probably depends on what state you live in.

This was New York State?

I got my first deer a little less than 2 years ago. Only problem was I
got 'er with a Honda Odyssey. Even though I asked nice, for some
reason the body shop wouldn't paint a little Bambi outline on the new
fender...
>
> Gasoline for the auto, what was it? $0.28 or something near there?

Until it doubled after the first OPEC embargo. But yeah, it was cheap,
as were used cars and parts. Plus you could work on 'em yourself.

Oddly enough, gas today is even cheaper, once you adjust for
inflation. It's one of the few necessities that has gone that way.

> Gosh, I
> can't remember all those prices. Baby food was, I think, $0.19 a jar

> it.

Yup. A lot depended on what it cost to wash the diapers vs. buying the
disposables. If you pay all your own utilities the cloth route gets
expensive real fast. If the water and electric are somebody else's
problem it goes the other way.

Then there's baby formula vs....no, I'm NOT gonna go there!
>
> Anyway, life may have seemed simpler then, and maybe it was to some degree.
> But, I'll take life today much quicker! I could not be shopping for a 2300

>
2300 sf would be a big house fer me, then or today. Location,
location, location....

I remember reading someplace that the biggest economic change in the past 30-40 years as it applies to average folks is this:

In the "old days", necessities were relatively inexpensive and luxuries were relatively expensive. But since then the trend has been for the necessities to get more and more expensive and the luxuries cheaper and cheaper. So now many hams can afford a $1000-2000 rig, but they can't afford a nice house on a big lot with no CC&Rs to put the rig in.

IIRC the minimum wage back in '75 was around $1.50, and there are about 2000 working hours in a straight-time year. (40 hrs/week x 50 weeks). So you folks were essentially living on one minimum-wage income. Think about what those numbers work out to today...

Jim:

Ah, yes, the good old days. Challenging licensing requirements and uncompromising testing procedures. Of course, all that is waaaaay too PoliticKally IncorrecKt today, since someone with a particular ethnic origin, skin color, religion, "gender," or a hangnail might not be able to pass the first time or two. This certainly won't do in these enlightened times. After all, it might "exclude" someone who is, in reality, a nascent technical genius who just needs the ability to talk on the HF phone bands in order to find the inspiration to create the next fabulous new invention which will revolutionize electronic communication for the rest of all time!

Yeah, here we go Jim:

Entry level license is the Smart!tician. Test requirements are eating
no less than 3 meals of meat per week. The successful applicant must
also demonstrate the ability to cooko pasta in at least 30 unappetizing
ways. Extra credit for recipes including Tofu.

Priveliges for the Smart!tician will be the same as the technician plus
is today.

Next up the ladder is the Generallyhealthy! class. Test requiremts are
to show the ability to fast for a minimum of 3 days, followed by a
cleansing diet of only fruit juices, in addition to the Smart!tician
tests. This is as high in the service as meat eaters can go * the lone
exception is noted below

Priveliges for the Generallyhealthy! are the same as the Smart!tician,
plus HF access in SSB only.

At the top of the sprout heap is the ExtraDelicious! license. This is
the epitome of both hamdom and the oh so healthy lifestyle. The
ExtraDelicious! *must* be a vegatarian, specificly a vegan. *The only
exception to this is that medical waivers can be granted for
lacto-ovarians, and in certain rare instances, for macrobiotics. These
must be signed by a physician.

The successful applicant for ExtraDelicious! must display the ability
to be condescending onto others, to announce their vegan status to every
person they meet within 45 seconds, and to be a general nuisance at
restaraunts, being required to ask the waitress of the possibilty of
animal products in everything in the facility, including the salt and
pepper shakers.

The ExtraDelicious! has all priveliges, as befits the obvious
superiority of this type of person.

> Seriously, though, it's not just a ham radio problem - it's an American
> problem. Just look around you. Combine an aging population, cheap sugary/fatty
> foods, sedentary but high-stress living, and a drop in other vices like
> smoking, and you have a recipe (pun intended) for folks getting heavier.
>
> I'm 6' 3" and my target weight is 180. I'll let ya know when I get there.

You have to be kidding, Jim! Unless you have an incredibly small bone
structure, that will be hard to attain. I'm not too wild about the way
"they" figure the body weight thing out either. It really has to be done
more on a fat percentage thing rather than some stupid one size fits all
approach. By the tables, I am considered grossly obese, and yet by the
fat percentage, not. Put me in the pool, and I sink like a stone. Fat
being neutral density as compared to water, allows the person to float
easily, and weigh relatively less in water than a person of high
muscle/fat ratio of equal weight.

Go figure! - Mike KB3EIA -

3707. Hey Carl-Glom this!

It meant something, in those... years, to be a telegraph operator. They were looked upon with wonder as possessing knowledge which separated them from the rest of the crowd.

There are some surprising parallels between the experiences of nineteenth century women telegraphers and the twentieth-century story of women in the field of computer programming. Some of these similarities are technically based; the telegrapher's work, like that of a modern computer programmer, consisted of translating English-language instructions into machine-readable codes. Morse Code is, in fact, a direct ancestor of the ASCII codes used by software programmers. The computer itself is the direct descendant of the telegraph; as Carolyn Marvin observed in "When Old Technologies Were New",

In a historical sense, the computer is no more than an instantaneous telegraph with a prodigious memory, and all the communications inventions in between have simply been elaborations on the telegraph's original work.

Proud of it!! She's eight years old and we go shopping all the time. I've
been teaching her to shop since she was about 18 months old. Every school
year so far, we've paid a visit to Payless Shoe Source. I save all Summer,
and when we go in the store I tell her to start picking until I tell her to
stop. We have a blast!

Oh, and she is my youngest son's daughter. Oldest has never had kids yet.

Well, yeah, deer are hard to come by if one is depending upon only "one"
man--and don't get any twisted ideas there... What I mean is, all the guys
used to start hunting on Season open. Good 'ol Rick usually got first meat
by Thanksgiving. He was single and, actually, going to college at the time
(he's the reason we were on the Plattsburgh campus to see Alice Cooper).
So, about three of us families would divvy up that one. Then, as it went,
there'd usually be one or two more and we'd divvy that one up. One could
end up with a freezer full of ground meat. My kids' Godfather tried to get
me into racoon and turtle but, dude, that weren't happenin'.

heh heh...yeah, or use them for freezers! We used to have a Ford Galaxy
that died on us in the middle of Winter. Same week, the fridge went. Well,
money was tight. So, we'd use the car to keep the refridgerated stuff in
and, believe it or not, it was actually cold enough to even keep ice cream a
day or two!

>
> Oddly enough, gas today is even cheaper, once you adjust for

Right here where we are at. Moving it in before the end of this year. And, it is big! We've decided instead of building, to go ahead and buy a manufactured home, and have a pier and beam foundation put in, then move it onto that. We can get more house for the money, it's vinyl sided, has the OSB top, bottom, and sides (marine grade), we've upgraded the carpet, have two living areas, 3 baths (if the home we think we've settled on ends up being the one we get), and I'll gain an extra bedroom to boot! That's in case my parents or my hubby's Mom ever has to come and live with us (the two living areas will accommodate a nice gathering and be good for if the parents have to live with us, too!).

Yeah, it seems that way. I was just telling my darlin' the other day that I still feel "priviledged" to shop for something in a store called Linens and Things (don't know if you have those up there). I remember when that store used to be for the rich folks (from my perspective).

>

2080 hrs. to be exact. And, that wage sounds about right. Hey, do you remember when 5-Friday months were the cat's meow? Or, did you ever budget that way? I budgeted based on a four week month. When those 5 Fridays rolled around, that was high cotton time!

Yes, I was a stay-at-home mom until my kid (one went to go live with his dad) was about 11 and then was working from home, so still was at home for him. I've only been climbing the professional ladder for about 18 years; somewhere around there anyway.

Radio. Yeah, I remember when we first became hams! I didn't know it, but Cliff had been saving from the time I'd gotten him interested in the hobby and we were going to classes and "studying." When we got our ticket--he started out with swim COW so he was a Tech+, he went out and bought a Yeas 890AT (or is that 850AT). Anyway, he got what was then a darned nice radio with all the bells and whistles. We already had a 70' tower up, with a 10M quad antenna on top. Man, that thing was nice. First bad wind that year (90 mph past the house--straight line winds) blew that quad over and broke one of the fiberglass spreaders. We could have replaced it. But, this was a 3-element quad for 10M. Imagine how darned big and cumbersome that thing was!?

you got a local CB'r or ham that you're mad at,
and want to plant a little device in his yard so
his reception is dead, huh?

I've heard people doing this before.... buying about
$5 worth of parts at radio shack, putting together a
transmitter the size of a matchbox and tossing it in
somebody's yard one night where he won't ever find
it... and until the small battery that is in it goes dead,
his ears are plugged up and he can't hear a thing.

>comes to $140,000 for an extra 10 years.

There was a report issued in some then-socialist Eastern European country a few
years back where the advice was to avoid antismoking programs! The report
showed that if the population stopped smoking, the longer lifespan would raise
retirement pension funding demands much more than the savings in medical costs.
Raised quite a stink when it became public...

BMI is a better indicator, but your point is well made.

Perhaps the best indicators are things like total cholesterol, LDL, HDL, resting heart rate, blood pressure, 12 minute test (how far can you

walk/jog/run in 12 minutes?) rather than weight.

You're right. Sorry. In my haste to catch up with so many new messages posted while off the newsgroup for a few days, I didn't notice that part. Having said that, I still don't see the justification for a change. There are also some conflicts. For example, how would you justify to new hams, who, from the description, basically passed the same tests as existing hams, that their privileges are restricted while privileges for existing Techs and Tech Pluses are not. Why is one group able to operate safely and properly while the other isn't (enough of a difference to justify greatly restricted privileges)?

In the end, I don't see how this addresses any current issue in ham radio. There are already three license classes (Tech, General, and Extra), so all you would do is rename them (which doesn't do a whole lot). Some HF privileges could just be added to the existing Tech license, without all the effort to mess with the other license classes and license exams (much easier for the FCC). Adding HF to the Tech license would increase it's appeal, which addresses the need to attract new people. Dropping code from the other license classes (General and Extra) would increase their appeal, which would attract more to upgrade.

In other words, just about all you're trying to accomplish could be done much more easily (by minor modifications to the existing license structure). This simple fact undermines your idea.

Bruce, I've having a hard time even believing you have a license. Based on your poorly written messages in this newsgroup and others, I don't see how you were literate enough to even understand the license exams? Clearly, you're one of those who had to memorize the question pool instead of understanding the content. Now that you have a license, you still don't seem to understand the concepts behind ham radio - the concept of "goodwill" obviously went right over your head.

Hey, the "Golden Corral" has much better food than the so-called fast food joints, and it's cheaper too. Take out is especially inexpensive. Where else can you get a steak dinner for two to thee bucks?

Irrationally afraid of nuclear power? According to the UN, there have been 386 serious nuclear power plant accidents around the world (serious defined as a significant release of nuclear material into the atmosphere). Several of those accidents have been right here in this country. In addition, there have been over 6,000 nuclear weapons tests, resulting in millions of tons of radioactive material spread across this planet. Nobody is certain how many nuclear weapons accidents there have been. And, since records are not kept, nobody is certain how many accidents there have been at nuclear research facilities. The nuclear industry, peaceful or military, has been no friend to this planet or it's people. And that's not a "PC" perspective - it's simple common sense.

With all due respect, Larry - were you there?

Did you have to take a sending test?

Did you have to pass all of the elements to upgrade at the same time?

Did you have to wait 2 years to even try the Extra?

>Challenging licensing requirements and
>uncompromising testing procedures.

They've been "compromising" forever. Back before WW2 the exam was all blue book essays. Before 1960 there was diagram drawing. The tests I took in 1967-70 were "dumbed down" compared to those because my tests were all multiple choice.

>Of course, all that is waaaaay too

None of that had anything to do with the license test changes.

Incentive Licensing came about in LBJ's time

Dick Bash did his stuff (and got away with it) when Nixon and Ford were in office

The change to the VE system happened under Reagan

We got medical waivers because a "king" wanted a favor from George Bush 1.

We also got a nocodeham license because of GB 1.

Etc.

No, no, no. Bruce didn't memorize anything. He took the exam on a
lark, w/o studying, and scored 100%. Furthermore, he did it in under
8 minutes, and collected $250 from a couple of "CB Plussers" who bet
he couldn't do it.

But he breaks into a sweat every time he has to sign his paycheck.

Larry, instead of complaining all of the time about others, why don't you relate to us how you've revolutionized radio communications?

BTW, how's your WAS coming?

Saw in QST where a ham had 48 states in 1957, then completed WAS with Hawaii and Nevada in 2003. No doubt another revolutionizing operator.

Yes, irrationally afraid of nuclear power. Nothing you said there convinced
me otherwise.

Keep in mind the fact that fossil-fuel burning plants pollute while working
perfectly. Unlike the nuclear plants, they don't have to wait for an
accident in order to cause a problem.

The following comments address power plants only. Weapons is an entirely
different issue.

Yes, irrationally afraid. The number of deaths from nuclear power plants
pales into insignificance in comparison to the number of minors who have
died to bring us coal to burn not only from accidents but black lung
disease. The damage done from nuclear power plants pales into
insignificance in comparison to the damage done from oil spills. More
people have died from dams breaking than power plant accidents.

If we applied the same logic and standards to other sources of power as we
do to nuclear, we would not have any electricity at all. We'd have to shut
down every coal, oil, and hydroelectric power plant in the world.

Nuclear power is the cleanest, safest, most efficient form of power
generation available at this time.

Wind and solar have to be excluded at this time since the technology doesn't
exist to make these forms widely available on an efficient basis. And if we

follow the logic of some people in this group on other items, wind power is too antiquated since it's been used for hundreds if not thousands of years.

And let's compare nuclear power to some non-power industries. Are you aware of how devastating accidents at chemical plants can be? Have you ever seen a grain elevator explode from sparks causing the suspended dust to explode?

I'd rather live next to a nuclear power plant than any other type of power generating facility or any of several other industrial endeavors.

Absolutely correct. Hands down. Although undeniably, all the comments about deaths from other energy sources aside--an incident with nuclear power carries much further impact and potential for harm than from any other source (currently in use). While deaths and environmental impact may be higher in number than from nuclear incidents, I think it would be found that nuclear power/nuclear anything has greater risk than is immediately recognized.

Take a coal mine. At any one coal mine there are probably folks who have, and who have already died from, black lung or other health diseases; there have probably been some people maimed and killed from caves, and there have probably even been some serious environmental effects from the mining of coal. But, one (serious) incident at a nuclear power plant--take Chernobyl since that's the worst in history--and you have generations of trouble: to the environment, to disaster recovery; to ecnomical and infrastructure; and we haven't even mentioned the immediate and long-term health effects.

He's trying to blanket the topic anyway....
NCI isn't trying to stop or ban the use of morse
code on the airwaves, they simply understand that
the testing of morse code no longer falls within
the scope and original intent of ham radio.. which
is to keep the art of radio alive and expand it's use,
etc., and, well, logic there says that if morse code
is being abandoned left and right in the radio world
in favor of new means of communication, than you
you are no longer adhereing or supporting this
doctrine of ham radio.

Plus, the real reason the old buzzards want to keep
it around is simple but non well-founded.. "I did
it, so YOU should have to!"

Again not so. Only 31 people died from Chernobyl. Even now there has been
no increased incident of deaths from diseases that may possibly be linked to
radiation. The area where the fallout could be discerned from the normal
background measurements was relatively small. In addition, that accident
was due to an unauthorized experiment being conducted at the facility. In
other words, rules and safety precautions were being deliberately ignored.
Nuclear power generation has been round for 50 years now. A total of 34
people have died. That's the 31 at Chernobyl and 3 in the 1950s at an
experimental government facility (where once again regulations were not
followed).

The collapse of hydroelectric dams have affected areas as wide or wider than
a nuclear power plant accident. And they have killed more people. I'd much
rather live next to a nuclear plant than downstream of a dam.

And speaking of long term environmental impacts, what about thousands of square miles that are supposedly affected by acid rain from burning coal?? What about the miles of coast and ocean that have been contaminated by oil spills?? The long term effects could be quite significant.

So if an honest evaluation and comparison of long term effects, deaths, environmental impacts, etc is done and the same standards applied across the board, then it would indeed be necessary to shut down all oil, coal, and hydroelectric plants. Personally I don't care to sit in the dark and shiver.

Now let's take a look at serious industrial accidents. A prime example is the chemical plant in Bhopal. 3,000 people died immediately when that happened. As many as 10,000 people have died from long term effects of exposure to the gas released since it damaged their lungs and other organs. No one is shutting down the chemical industry. Yet some chemicals are as persistent in the environment as nuclear materials.

So sorry to say, your long term environmental arguments just don't hold water. There's lots of things that can affect even wider spread areas and last just as long.

If you want my take on the whole nuc power issue, the techies have
placed the blame on the public, while so very much lies within themselves.

You try to convince the public that the reactor is safe. What they
remember is that they were told that Chernoble was safe. The public is

left to sort out who is telling the truth, and who is not. And the superior attitude of the techies did not help. Any guess why they chose not to believe anyone?

I think that the way we were building the things was an inherently unsafe situation. The concentration of so much power in one or two relatively small places (per area served) is not an inherently safe operation. It achieves economy of scale, but in the end, probably didn't even do that.

Mistakes were made in the basic premises. And yes there is an element of irrationality with peoples reaction to the problem. Can you completely blame them? The techie person will answer yes, no doubt. But that is being as irrational as they are, because it ignores that they HAVE to be convinced.

Don't get me wrong, I a a firm proponent of nuc power. I just think it has been handled very very poorly by the Techies.

As the world is now entering it's period of geometric population growth, there I have no doubt that nuclear power will make a return; the other choice is no power at all. The population growth is poised to consume most of what is left of the fossil fuels, and will probably do so in a surprisingly short time.

Great job Clint!
You spoke the words exactly as written by Cpt. Carl. You would make a good
Liberal, you follow orders so well. You might want to call the DNC and see
if they could use your during the next election.

Good luck!

10-73's!

Yup. So do nuclear plants. The pollution in each case is different, of course.
Nuke plants generate various forms of radioactive waste that will remain
hazardous for far longer than anyone realistically knows how to deal with.

>Unlike the nuclear plants, they don't have to wait for an

No, you couldn't. Your constant barrage of anti-Amateur Radio
rhetoric is strewn with evidence of a gross misunderstanding of
Amateur Radio at SEVERAL levels, Vippy...You don't understand it's
purpose, it's "language", nor it's role in our communities.

Too bad for you. It's a lot of fun. If you'd quit trying to
mold Amateur Radio into what YOU want it to be and take what it
offers, you'd have a lot more fun...Problem is you keep thinking that
this is Burger King...You want it "your way, right away", and you get
ill when it's not delivered to you on that silver platter.

Boohoo for Vippy.

Not from Power Generation Facilities. I'm not counting bombs and bomb
testing. And keep in mind that power plants can't blow up. They can melt
down, which confines the effects to the building. They can release
contaminated steam, which is diluted very rapidly to background levels of
radiation.

I agree there. Tech types have a tendency to forget that they have to address emotions. Sometimes facts will help and sometimes not. The facts must be presented not in a "I assure you that it is safe" but in "here is the data" and give people time to mull it over and come to their own conclusions. However as in any other endeavor there is no guarantee that it will work.

Eventually need will indeed bring us to nuclear power. We are still reacting to the shock of our parents over the devastation caused by the only two nuclear bombs ever used in war and the multitude of science fiction movies and novels about life after the bomb. Our country is still suffering from the guilt of having used these weapons. But as they say, time heals all.

No bigger a problem than a hydroelectric dam breaking. The BIG problem is the slanted and sometimes false information that is spread by the media just to have an exciting story.

The operative phrase here is "expand its use", not diminish
it by refusing to learn the Most Basic Radiocommunications Mode.

>
> etc., and, well, logic there says that if morse code
> is being abandoned left and right in the radio world
> in favor of new means of communication,

When you finally get around to getting a radio that will actually
work on HF, take a listen to the lower end of any band and report
back what you find. Then you might want to 'accurize' that statemtent.

> than you
> you are no longer adhereing or supporting this
> doctrine of ham radio.

And of course YOU and NCI are, to hear your story.

WRONG story, full of total inaccuracies which you have
no interest in correcting. Who do you suppose is involved
in 'advancing late digital modes'? CLUE: It's not Carl Stevenson,
Chief Executive of NCI, you see
he's too busy ratchetjawing on SSB now that he's finally found a
license that allows it!

>
>
> Plus, the real reason the old buzzards want to keep
> it around is simple but non well-founded.. "I did

There is an unintended element of truth in what you say. WE had to
learn radio's most basic mode, and there exists no good reason why
you shouldn't have to learn it also if you aspire to a full-privileges
ham raduio license.
Othewise you may very well to find yourself
on your arse groping for a useless microphone.

- which is one facet of the PC cult.

I remember the first time I heard the term "political correctness"... I remember thinking that they must be talking about Red China and their crude brainwashing experiments, back in the 1950's. It most certainly leaves that same bad taste in the mouth, doesn't it?

Then I found out that it was the latest thing going on in U.S. politics, and I thought it was a joke. Surely after winning the cold war and conclusively proving that socialism was a miserable dead-end, we would not be stupid enough to take on the trappings of the corrupt, backward culture we had just defeated.

Imagine my surprise when it turned out that many people really ARE that stupid! Amazing, isn't it?

Well, it's unhealthy, so you're off the hook.

True fact: The *original* antismoking campaigns had nothing to do with health
concerns. Their real problem with smoking was that it was perceived to be an
activity done *only* for pleasure - and therefore evil! (You have to eat and
sleep, so those activities were not targeted as much).
>
>If it's any consolation to you, the Atkins diet followers think I
>guzzle carbs the way a 1972 Cadillac guzzles fuel. (According to news

Why "ugh"? If that diet works for some people, that's a good thing.

Do you understand the relationship of carbs and insulin?

>The anti-meat anti-fat Ornish diet followers
>think I guzzle fat the way a 1972 Cadillac guzzles fuel.

There are all kinds of fats. Some are needed, some are almost poison.
>
>I guess I must be eating right if other hams think I'm on a crash diet
>and the followers of the latest diet fads think I eat like a hog.

No, you're eating right *for you* if your weight and other indicators are good.

George Sheehan used to say that each of us is an "experiment of one", and that a big part of living is trying out different approaches and seeing what works best for each of us at various times of our lives.

For example, I've found that eating mostly sugary and carb-y foods causes me to gain weight and be tired. Plus I'm hungry all the time that way. Eating the same number of calories in protein and healthy fats causes me to lose weight, have more energy, and be much less hungry. So instead of cereal and skim milk for breakfast I have a veggie omelet. Works for me. YMMV.

>disease.

How do we know this is true? Are there no accidents in uranium mining?

Part of the problem is the difficulty of data gathering. If a miner works in a deep mine for 30 years and dies of black lung, it's a safe bet where he got it - and that gets recorded.

But if someone works in nuclear processing job for a few years develops cancer or leukemia 20 years later how do we establish a causal link? If a baby born in

Harrisburg in 1980 had a birth defect that becomes fatal 10 years later, does that get counted as a result of the Three Mile Island accident?

>The damage done from nuclear power plants pales into
>insignificance in comparison to the damage done from oil spills.

Specifics, please? I'm not defending oil spills, but their effects are clear and observable.

>More
>people have died from dams breaking than power plant accidents.
>
Maybe. Again, the problem is one of data collection. If Holtwood Dam (a few miles from TMI) fails and somebody drowns, that's obvious and recorded. If somebody who was downwind of TMI in 1979 gets cancer as a result of exposure, who can prove it?

>If we applied the same logic and standards to other sources of power as we
>do to nuclear, we would not have any electricity at all.

I disagree!

>We'd have to shut
>down every coal, oil, and hydroelectric power plant in the world.
>
>Nuclear power is the cleanest, safest, most efficient form of power
>generation available at this time.

Based on what statistics?

First off, to compare apples to apples you have to consider things like how many KWH are generated per fatality. Yes, it's a gruesome stat, but that's how risk assesment works.

Second, the risks take different forms. For example, a coal fired plant, even with the best pollution control, spews a measurable amount of pollution into the air.But a coal plant cannot melt down or leak massive amounts of long-lived pollution. OTOH, a nuke plant emits much less pollution per KWH generated, but it can have a meltdown or leak that contaminates a wide area for an unimaginable length of time.

Then there is the matter of nuclear waste. How is it to be dealt with? Where is it to be stored for the enormous lengths of time required for it to become reasonably safe? How are nuke plants to be decommissioned?

When the technology was new, we were assured that long before nuke waste became a problem, there would be systems in place to deal with it. We're still waiting for those systems. We were also told that nuke power would be "too cheap to meter" and other such George jetson nonsense. Still waiting...
>
>Wind and solar have to be excluded at this time since the technology doesn't
>exist to make these forms widely available on an efficient basis.

I disagree again!

Wind technology has come a long way and is becoming competitive with other forms of generation. How many trillion dollars of tax money has been poured into nuclear power research since 1945? How does that compare to wind power research?

>And if we
>follow the logic of some people in this group on other items, wind power is
>too antiquated since it's been used for hundreds if not thousands of years.

HAW! Good point!
>
>And let's compare nuclear power to some non-power industries. Are you aware
>of how devastating accidents at chemical plants can be? Have you ever seen
>a grain elevator explode from sparks causing the suspended dust to explode?

Sure. But when a grain elevator explodes, it does not leave long-lived waste all over a huge area. Nor does its operation generate things that look harmless but will be very dangerous thousands of years from now.
>
>I'd rather live next to a nuclear power plant than any other type of power
>generating facility or any of several other industrial endeavors.

OK, fine. Does that include a wind farm?

But would you rather live next to a nuclear materials processing facility? Or nukewaste storage facility?

The BIG problem with evaluating risk in a real world situation is that the math doesn't tell the whole story from a human perspective. The risk of a catastrophic nuke plant accident is very small, but the results of such an accident are very bad.

How many people has the Chernobyl accident killed - so far? How much economic damage? How much will never be properly recorded?

Yep, my point exactly. And, waste generation and facilitation is a part of the equation I completely forgot to even include in the debate. And, it's a very important part of the issue.

Suffice it to say that no one will ever convince me that nuclear generation is a cost/environmental/health effective way for our power needs. It will never happen to be that nuclear generation is the way to go...and the industry recognizes that as well. No new nuclear power generation is planned, 'least not that I know of...

Without elaborating--and I know that is difficult--let me assure there will be no future nuclear generation plants; that is, if we define "future" as maybe even a little longer than the next 200 years. Beyond that, maybe. There's too much new technology surfacing that will alleviate current trends in electric generation to even consider the high cost and volatility of a nuclear solution.

You might make it clear that California hasn't built any new plants of ANY KIND because the environmentalists wackos are blocking them. It's not just nuclear they are blocking. They have taken the step that any risk whatsoever is unacceptable. Actually I'm amazed that there even willing to take the risk of getting out bed. Maybe they don't even use beds since they could fall out and break their necks.

>radiation.

Directly attributed deaths. If a pregnant woman 1000 miles away was exposed to high levels of windblown radiation, and her child developed leukemia at age 2 and died as a direct result of that exposure, how does that death ever get attributed to the Chernobyl accident?

>The area where the fallout could be discerned from the normal
>background measurements was relatively small.

How many square miles? How long will it be hot?

>In addition, that accident
>was due to an unauthorized experiment being conducted at the facility. In
>other words, rules and safety precautions were being deliberately ignored.

Yep. Absolutely true. And I've never seen any reason given.

But these were not stupid, evil or suicidal people. They just did some amazingly dumb things, which got out of their control. And perhaps that's the real lesson of Chernobyl: People will do amazingly stupid things for no explainable reason at all. Then the rest of us are left to pick up the pieces.

But when technology is small and distributed, the effects of doing amazingly stupid things for no explainable reason at all are contained to a relatively small area and numbers of people. When technology is huge and concentrated, the effects can be much worse.

And the more complex the technology, the easier it is to do something really dumb.

>Nuclear power generation has been round for 50 years now. A total of 34

>And speaking of long term environmental impacts, what about thousands of
>square miles that are supposedly affected by acid rain from burning coal??
>What about the miles of coast and ocean that have been contaminated by oil
>spills?? The long term effects could be quite significant.

Sure. But not as significant as the effects of radioactive materials that take millennia to break down.

Consider just one spent fuel rod from a nuke plant like TMI. How long before it is harmless?
>
>So if an honest evaluation and comparison of long term effects, deaths,
>environmental impacts, etc is done and the same standards applied across the
>board, then it would indeed be necessary to shut down all oil, coal, and
>hydroelectric plants.

I'd like to see such a comparison.

> Personally I don't care to sit in the dark and
>shiver.

It's not a binary problem.

>Now let's take a look at serious industrial accidents. A prime example is
>the chemical plant in Bhopal. 3,000 people died immediately when that
>happened. As many as 10,000 people have died from long term effects of
>exposure to the gas released since it damaged their lungs and other organs.
>No one is shutting down the chemical industry.

The chemical industry in India does not have anywhere near the safeguards of the chemical industry in the USA.

And as horrible as the Bhopal disaster was, the gas dispersed and will break down. How long will TMI be radioactive?

>Yet some chemicals are as
>persistent in the environment as nuclear materials.

Some examples, please?

A process can be developed to break down any chemical compound. PCBs, for example, were specifically designed to be inert and nonreactive, yet they can be broken down into their components quickly. But there's no way to speed up nuclear decay.
>
>So sorry to say, your long term environmental arguments just don't hold
>water. There's lots of things that can affect even wider spread areas and
>last just as long.

Perhaps we should discuss the half life of plutonium?

And if you're going to discuss dangerous industrial processes, consider this: The most dangerous common form of mechanized transportation in use today in the

USA are privately owned motor vehicles. Every year and a half, about as many Americans die on US highways as died in the entire Vietnam war. Airlines, trains, buses and ships are far safer, yet few people refuse to drive or ride in a car compared to other modes. Why?

>>
>> Nuclear power is the cleanest, safest, most efficient form of power
>> generation available at this time.

>Absolutely correct. Hands down.

I disagree. Terms like "clean", "safe" and "efficient" have to be defined for
the context.

And we have to include technologies like wind turbines, which require no fuel
and make pollution that is ignsignificant compared to their competition..

>Although undeniably, all the comments
>about deaths from other energy sources aside--an incident with nuclear power
>carries much further impact and potential for harm than from any other
>source (currently in use).

Bingo.

>While deaths and environmental impact may be
>higher in number than from nuclear incidents, I think it would be found that
>nuclear power/nuclear anything has greater risk than is immediately
>recognized.

And that's the problem - the risk and bad effects may not be well understood
yet.

It should be noted that levels of radiation exposure once considered "safe" are
now considered "unsafe", based on long term research. With both animals and
humans.

>Take a coal mine. At any one coal mine there are probably folks who have,
>and who have already died from, black lung or other health diseases; there
>have probably been some people maimed and killed from caves, and there have
>probably even been some serious environmental effects from the mining of
>coal.

Most power generation coal nowadays is surface mined. Powder River Basin, for
example, is in demand because it's low sulfur.

>But, one (serious) incident at a nuclear power plant--take Chernobyl
>since that's the worst in history--and you have generations of trouble: to
>the environment, to disaster recovery; to ecnomical and infrastructure; and

>we haven't even mentioned the immediate and long-term health effects.

EXACTLY! "Generations of trouble" - that's the real problem.

The Chernobyl design was not a good one for a number of reasons, yet they kept using them. The "sarcophagus" built to contain the building is failing, after less than 20 years.

But the biggest problem is that nobody really knows how to clean up the Chernobyl mess. Or the Three Mile Island mess, which is approaching its 25th anniversary.

It is my understanding that the oldest "commercial" nuke plants are approaching 50 years of age. To my knowledge, none of them have been decommissioned, in part because nobody knows how to do it safely, or what to do with the pieces. Or who is supposed to pay for it. If a nuke-owning utility doesn't have the money to take care of an old plant, who's gonna pay the bill?

And the ultimate problem may simply boil down to money. Even if everyone accepts the risks of nuke plants, the total cost per kWH over the life of a plant may not be competitive. Particularly when you consider the enormous first cost, interest charges, and the decommissioning costs. These costs occur when the plant is not making any juice, too. Ultimately the utilities look at the numbers and say "where was that information on gas turbines?"

>

Dissipation will be by the inverse square law so at 1000 miles from the
plant it will have a concentration of only 1 millioneth of the concentration
at the release site. While specific deaths can't be attributed, the overall
numbers can be assigned by simply comparing the death rate due to leukemia
in the affected zone to the death rate outside. This can be done for each
cause of death that can be increased by radiation. If society wants the
data, it can be gathered. But people would rather hide behind the emotional
fear of possible problems than researching what problems will occur and the
magnitude of the problem and making an enlightened decision.

Not proven. Millennia worth of acid rain could conceivably be just as harmful as the time taken to breakdown radioactive materials. Why? Because even though the acid rain dissipates, it keeps on coming down year after year.

> Consider just one spent fuel rod from a nuke plant like TMI. How long before it
> is harmless?

Let it be reprocessed and recycled and it's not a problem.

> I'd like to see such a comparison.

I would too. It is exactly the type of data that we as a society need to make informed decisions about our energy future. Right now we are stuck with people's emotional reactions. I should have said "...it would probably be necessary..." My point was that people are refusing to even consider the dangers of other means of power generation.

> > Personally I don't care to sit in the dark and
> >shiver.
> It's not a binary problem.

It's getting close to that in California although shivering will be mild (except perhaps up in the mountains) as it isn't a severe climate. California has built no new power plants of any kind in 10 years. They can't get any of them (fossil fuel, hydro, or nuclear) past the environmental requirements in the state. Population continued to grow and they had brown outs and blackouts. Their solution was to buy it from out of state. Well that hasn't worked either. The rates are simply too high and the state can't afford it. Costs are being absorbed by the state government instead of being passed to the users and it's wrecked the state budget. It looks like those contracts will be canceled and California will be right back to their brown outs and black outs.

TMI has been contained so it will not impact the surrounding residents.
Long term radiation exposure thus becomes a non-issue.

Yes you can speed up radioactive decay by reprocessing and reusing the spent
fuel. While PCBs can be broken down, it's not being done due to cost. Save
with PVC. Same with other chemicals.

1. Convenience
2. It's what they are used to
3. Each feels they are in control so it can't happen to them.

Just because we do something doesn't mean it's rational. Mankind is a rationalizing animal. We will find justifications for our wants and desires and fears whether there is any basis in fact for them or not.

that's expanding the use and art of morse code, not expanding the
use and art of radio in general. For that matter, there aren't
profeciency tests in other modes of operation, either, in the
form of a seperate practical test such as there is with CW.

Lied to about what?
As to the last "world conference" (presumably meaning WRC2003),
you should know the ARRL had NO voice in the conference as
they could only be there as an observer. The conference was
a representation of individual country's regulatory
administrations.

Cheers,
Bill K2UNK

Good heavens, Dee. You could also point out that people are content to
hurtle themselves at each other at relative speeds of 140 miles per hour
and above in metal and glass boxes containing very dangerous flammable
fluids.

But I'd probably call that slippery sloping the issue.

>>I think that the way we were building the things was an inherently
>>unsafe situation. The concentration of so much power in one or two
>>relatively small places (per area served) is not an inherently safe

> My point was that it is no riskier than things we accept on a daily basis.
> As I commented above, there is nothing that is truly safe.

No there isn't. But fact is, the safety must be addressed. THe idea
that all is well, and mockery of safety issues is how we get places like
Love Canal and Chernoble. Would you care to go live in either of those
places? Those people were told "There's no problem." Now when people
come around and tell people "There's no problem" the reaction is quite
different

And Jim mentions the waste disposal problem. This IS a real problem, as
beyond whatever safety precautions we put on the material, it is going
to be nasty stuff for a long time. And there we are telling people

"there's no problem" in storage again.

I feel in discussing this with you that I'm being pushed into the anti nuclear power group, when I can assure you that isn't the case. What is obvious to me is that due to the history of this topic, people have a pretty good reason to be skeptical.

well, I was speaking mostly about the nations that seem to
fight us tooth-and-nail on most issues we bring before them,
particularly the UN... my point was that I wouldn't expect
a sympathetic ear on thier end if they all have come to
an agreement amongst themselves and WE are the
outstanding oppinion. That is to say, if the reports i've heard
and that are echoed in here that many nations are dropping
thier code requirements, and more are planning on doing the
same, and of ALL countries to fight it the USA tries,
I wouldn't hold my breath.

This is elementary school, middle school, and high school. Perhaps I should have used the word cursive instead of script as you seem to have totally misinterpreted my statement to mean something else.

Students must learn printing and writing in cursive before they are taught typing and word processing.

They just don't get it (the PCTAs that is).

Ending morse testing should happen because there
is NO logical/rational reason for government to
continue mandating morse knowledge of all HF licensed
hams. Getting the government out of a "morse code affirmative
action program" by ending mandated morse is far more
a conservative concept than a liberal one.

Cheers,
Bill K2UNK

I quite agree that safety must be addressed and that people should be
skeptical. I would certainly insist on seeing the data to show safety
rather than just letting someone tell me it's safe.

The point I was trying to make is that people are allowing themselves to be
scared off of nuclear power by emotional arguments and are not exercising
the appropriate degree of skepticism on these arguments and demanding data.

The "I think, I feel, I believe" approach has no place on either side of the
argument. But when people let fear get in the way of seeking facts to
resolve the issue, then they are doing all of us a disservice.

well, so often what happens is that when a person expresses
an oppinion against testing morse code profeciency, he is
assailed with the PCTA crowd with accusations of hating
the code, wanting it taken off the bands, and even worse
things that reach the comical level.

I do not HATE CW; I actually have a key, and I actually
make code contacts from time to time. In fact, my first many
QSL cards were CW contacts on 15 meters; for a while,
until I upgraded to general, thats all I did was operate CW
on 15.

I just also realize that there is no need to continue requireing
a profeciency test in CW; the argument referring to advancing
the radio art no longer holds water as the radio art is slowly
phasing CW out in many sectors of SW use.... and the argument
that it makes a good "yahoo" filter is wrong, due to the fact
that most of the onair violations are made by very veteran hams
with advanced liscences... thus, they themselves passed a code
test. I have NEVER heard stronger advocates of the rules than
by new hams that pop on VHF repeaters, who will get
rather brutal with you if you so much as make an off-color joke.
Tune into 40 or 75 meters and you'd think you had tuned into
27.185 Mhz, good buddy.

It is NOT refusing to learn...it is simply allowing the
choice to be made by each individual. There is no
reason for everyone on HF to know morse as was
well shown by the lack of any credible reasons given to the
FCC in 98-143.

> > etc., and, well, logic there says that if morse code

Let's see...a mix of morse and data. Your point?
The choice then, depending on what one wants to do,
is to learn and use morse IF they want to make those contacts.
If not, who cares? So what?

> > than you
> > you are no longer adhereing or supporting this

At least you admit it. that's some progress.

> WE had to
> learn radio's most basic mode, and there exists no good reason why
> you shouldn't have to learn it also if you aspire to a full-privileges
> ham raduio license.

BZZZT - WRONG!! The burden of proof was on you and other
PCTA's to justify exactly WHY hams should learn it. You failed
to do so during the 98-143 comment phase as is well
documented in the FCC's R&O for 98-143.

Even if I take your challenge at face value, the
simple answer is that the reason every HF shouldn't have to
learn morse is because there's no justifiable reason,
rational or need for it.

Cheers,
Bill K2UNK

that's a good point... sending and receiving CW isn't a building block
to anything else..... now, the electrical principals of what a CW
transmission is, and a knowledge test of that is a good idea, but
that's comparing apples and oranges. I think most of the PCTA
is being disingenuous when they come up with "good reasons"
to keep CW testing alive; I think the true deeper reason lies
somewhere in the "I had to do it so everybody should" relm,
as i've stated before.

Has nothing to do with "wackos", Clint. Nothing at all. It has everything
to do with Board Room decisions for publicly held corporations who have
learned thier lesson losses from the construction, start-up, and generation
of power from nuclear power plants. They are not cost effective in any way.
They've become a pariah on the backs of the companies who have already built
and own them.

Sad to say, I think you're totally wrong. The above statement(s) are
speculative at best and sensationalistic at worst. Nuclear power is
economically unfeasible--proven by the plants already built and generating
in this country. Leave alone all the implications of environmental and
health impacts. They are just plain bad economics.

It's a popular thought in the environmental impact world that the "solution to pollution is dissolution" or something like that. And, of course, that's wrong. On its 1000 mile (more actually) trip to infinitesimal measurement, how much impact did it have along the way?

>

If you don't believe that promoting and expanding the use of radiotelegraphy is doing same to "radio in general" there is news you've not yet heard.

> For that matter, there aren't
> profeciency tests in other modes of operation, either, in the
> form of a seperate practical test such as there is with CW.

Ah, but Morse is the only mode which demands selftraining! Any mope can learn any of the others by cracking a book and doing a little hookup wiring. With manual radiotelegraphy, there is really no way to do it short of selftraining. Thus the CW test.

>

>

By commercials and military, yes, for both efficiency in transferring huge amounts of data, and primarly in some services for monetary reasons. It's cheaper to use modes that non-technical personnel can handle, thus saving personnel costs. If they can add communications as a duty to personnel othewise assigned, it is cost savings, nevermind that the newly assigned person may be squeezed for time to perform all those added duties, thus causing safety and job

efficiency to suffer. Dollars are conserved, so it is done.

Ham radio has no such needs nor constraints, even for emergency comms. Maximum throughput is the *last* thing you need when the desperate need is for *any* communications. At that point what is needed is basic, reliable, ubiquitous communications modes. In ham radio, Morse is second only to the voice modes, by far. I can imagine that NCI strongly favors changing that, despite their statements to the contrary - for obvious reasons.

Well, you old Hoop jumper, none of that has anything whatever to do with radio communications, much less ham radio nor Morse code. It's just more NCI mumbo jumbo drivel straight from the Carl Stevenson X files.

If you refuse to learn how to handle radio's most basic mode you can never be able to regard yourself as fully qualified in ham radio communciations.

That's just the Way it Is. Live with it.

Wrong, because radiotelegraphy IS the most basic radio communications mode,
the use of which is possible only if the operator has self-trained enough to
be able to make use of it.

Manual printing and cursive aren't a foundation for any other skills either. All notes can now be take by digital recorders or entered into a PDA. Bills can be paid on line eliminating the need to sign checks. Debit cards can be used in stores and you enter your PIN number. Credit cards could be converted to that system too. Manual printing and cursive can be totally eliminated as they are not needed as a foundation for any language skills since one can learn to read without writing. Composition doesn't need manual skills either. It can all be done on the typewriter or word processor.

Let's have a go at "No Handwriting International".

So why hasn't California built any oil, coal, or hydroelectric power platns in the last ten years? I'll tell you. They too are being blocked by the environmentalists. Are they also economically unfeasible? It's unlikely.

The only way to eliminate all pollution is to eliminate the human race.
Since that is not a reasonable solution, it is up to people to develop
energy supplies and attach the appropriate safety requirements without the
emotional baggage caused by fear. To date, the nuclear industry has had a
much better safety record than many other industries and we have the ability
to make it even safer yet. Right now the irrational fears about nuclear
power are standing in the way of collecting the data that will prove it
either safe or dangerous and developing an appropriate energy action plan.
What data does get collected is buried on the back of the last page at the
bottom of the last column of the newspaper or doesn't even make it into the

paper unless it is something that they can sensationalize.

Dee, I find myself in the uncomfortable position of agreeing with you, but very much disagreeing with your argument.

Uranium miners get ill with apalling regularity. This is part of the overall cost of this method of energy production, unless you are force fitting your argument to include only the power generation stage. There are piles of radioactive tailings around some towns out west. Kids often play on them.

http://www.inmotionmagazine.com/miners.html

http://www.downwinders.org/cortez.htm

These are just a couple examples.

Is that directly attributable? Gosh who knows? Cigarettes were "not proven to be deadly until not all that many yars ago, while I have read literature from the 1860's that documented all the effects that tobacco smoking causes. My guess is that if a group of people involved in an activity show statistically significant trends in illness, some activity they have in common just may be responsible.

I don't suspect you will understand this, but part of your approach is exactly why people distrust what they are told about NP.

Heehee! Now THAT'S funny. As an inland resident of
NC, I can expect to be asked to deploy for volunteer duty *somewhere*.
Having seen the effects of hurricanes
and actually being in one (Hugo), I take preparations seriously. Ham radio
and CAP communications will likely be put to the test. Even if cell towers
survive (unlikely during the brunt of a storm), the traffic load could be
awful.

3819. New York Court Kicks Out charges against ham!

Newsgroup: rec.radio.amateur.policy
Date: 2003-09-15 03:28:56 UTC
From: Jerry <joxendi@bellsouth.net>
Message-ID: <Hla9b.7655$4j3.5266@bignews6.bellsouth.net>
Source record: 77234

* Court kicks New York ham's "police radio" case: A New York court has dismissed a misdemeanor charge against ARRL member Richard C. "Dick" Lalone, KC5GAX, for violating ¬397 of that state's Vehicle and Traffic Law. That section prohibits individuals other than law officers from equipping their vehicles with radios "capable of receiving signals on the frequencies allocated for police use" without first securing a permit. The section, which also prohibits knowingly interfering with police transmissions, contains an explicit exemption for "any person who holds a valid amateur radio operator's license . . . and who operates a duly licensed portable mobile transmitter and in connection therewith a receiver or receiving set on frequencies exclusively allocated . . . to duly licensed radio amateurs." In a nearly 1300-word decision, Judge John J. Hallet said it was clear the legislature never intended the provisions of ¬397 from applying to licensed Amateur Radio operators, and he dismissed the charge August 5. Susan Terry, KF4SUE, a former New York assistant attorney general, represented Lalone. ARRL President Jim Haynie, W5JBP, ARRL General Counsel Chris Imlay, W3KD, and ARRL Regulatory Information Specialist John Hennessee, N1KB, provided advice or assistance to Lalone.

I like THIS one. AW, poor cop, no donut. LOL!!!

She's wrong, of course, Dee. The newest nuclear power plant (AFAIK) is also the most modern and has the most output- Palo Verde, 50 miles west of Phoenix,.AZ.
It's *quite* different in construction than any other I've seen - if you didn't know it was a nuke you couldn't tell it from sight. No large cooling towers at all.
Power in that region is cheaper than it is in Missouri where we use coal fired plants with some hydroelectric, used mostly for peaking.

Interesting aside-the Thomas Hill coal fired plant in north Missouri was located where it is solely because of the large coal mine facility which is there.But-it turned out that coal was of high sulphur content.
So after the acid rain fuss got going, they had to stop burning Thomas Hill coal and import all the coal they use - low sulphur coal from Wyoming!

That's what happens when you put radio-based enforcement in the hands of unclued-in officers. It should have never gotten past the initial field stop.

Of course, if the amateur op doesn't have his license with him, the officer has reasonable cause to believe that the pre-emption does not cover him even though it still does, and if the rig has been modified so that it is capable of TRANSMITTING on the police frequency, the pre-emption is not valid even if the operator is a licensed amateur (per the FCC Public Notice on this matter many years ago).

Do you think it's that simple Dee? Another scenario is that the shakers
and movers found in more profitable to try to buy and sell existing
power from each other, until the inevitble happened. And it's not just
in CA. Its all over

It doesn't say much about the inteligence level of the prosecutor's
office either.

> Of course, if the amateur op doesn't have his license with him, the

I didn't see that as the case with the federal preemption as I read it.
What happens now that most radios will need to be modified to
operate on the 5MHz band?

Cheers,
Bill K2UNK

Good point Bill. I use my FT-817 in my car. If I modified it to transmit
on 5 MHz it would be able to transmit on police frequencies too.

Maybe not. The photo still had the orginal attribution on it (the web
address)
and might be "fair use". You can quote or copy a small portion of a work
but be sure to mention where you got it from.

And that's where your argument falls flat on its face. The point is operational, on the air *communications *. It's called OPERATING. Has nada to do with anything beyond, although placing a radiotelegraph on the air on HF happens to be, as well, the most simple of stations to get up and running.

It's the BASICS, Bill. When you can't appreciate the fact that radiotelegraphy is radio at its most basic it's no wonder
you can't understand the concept.

The entire point is that radiotelegraphy using manually encoded Morse remains as one of the most, effective, and COST EFFECTIVE means of radiocommunications, even after all the years it has been in excistence. But only when operators self-train to gain the skill to use it.

The FCC has every reason and more than ample justification to require EVERY ham to be able to actually pass traffic in Morse on the air. It's easy to make a case that the ability is a valid requirement for licensing. The fact that they have not chosen to do so is far more related to the wants and desires of a vocal few, and a whole lot of PC, than the actual operational traffic-handling capacities of the ARS.

Now you'll come back with the same old saw about how it's "no longer sued" for this or that. Just as though no such need will ever again present to the ARS, ever, under any circumstances. Whatta crystal ball jock you are!

Don't even have a shortwave reciever at this point, as where I live the RFI is ridiculous as hell. My current residence also as well must have been lined with lead at some point, as nothing can be recieved by either tv or broadcast am/fm radio either......

Until I move, HF is pretty much out of the question.....

Yes, as in regards to listening to HF voice..... Sounds just like listening
to CB. No, it is environmental conditions. Killer RFI that would make BPL
look like nothing.

<rattlehead@computronDOTnet> writes:

>sending and receiving CW isn't a building block
>to anything else.....

Yes, it is.

First, it's a building block to the use of the mode on the air. Although other services have pretty much stopped using Morse Code, hams use it extensivley, and an amateur license is permission to operate an amateur station, not a station in another service. Note that the Morse Code tests are at a very basic level. They're entry-level, nothing more.

Second, if someone wants to actually design and build radio equipment, having skill in Morse Code permits them to use almost anything from very simple to very sophisticated equipment to good advantage. Would you expect a newcomer to radio to build an SSB transceiver as a first project?

>now, the electrical principals of what a CW
>transmission is, and a knowledge test of that is a good idea, but
>that's comparing apples and oranges.

Why should there be *any* written test on theory if all a person wants to do is operate manufactured radios? If someone doesn't want to build a rig, why should they have to memorize all those symbols, diagrams and formulas?

>I think most of the PCTA
>is being disingenuous when they come up with "good reasons"

Well, if true, I'm certainly impressed. But, of course, I have serious doubts about that claim. In fact, I would consider it almost impossible (and Bruce certainly doesn't seem like the type of person who could go around doing the impossible). Heck, it would take almost eight minutes for even the fastest reader to read over the the exam questions. And, considering some of the questions in the pool (band limits, etc), I doubt one could pass without at least some study (even if the study is nothing more than experience).

Pure bullshit Dan, the formula changes for a quarter wave versus a half wave versus a full wave. 468/freq. in Mhz is for a half-wave dipole. The specific for a quarter-wave is half that. And so on and so forth.

If the person specified which length they were looking for I would have popped up the correct answer, as far out to the right of the decimal as you want (yes, calculated by hand, not calculator. I do it the old fashioned way), but they didn't specify which wavelength they were looking for.

Yep... for a half-wave dipole.

Most would consider the massive amounts of nuclear waste (from spent fuel, contaminated building materials from closed plants, and so on) a "problem." People over many generations will have to deal with those waste products. And, of course, this environmental polution is far worse than anything generated by fossil-fuel burning plants. So, your claim above ("unlike the nuclear plants...") is patently false.

Exactly what data is that, Dee? I've read lots of data on nuclear power plants and little of it supports your views on that industry. When all things are factored in (construction, deconstruction, waste management, and so on), nuclear power is the most expensive power generated. At the present time, most of that cost is being shouldered by the American taxpayers, not the present or past plant owners. Of course, that fact, and only that fact, makes nuclear power profitable for the owners (which is exactly why they continue to push for new plants).

Wind currents don't follow laws, Dee. There will be areas with much higher concentrations, and areas with much lower concentrations, over a given geographical area.

Yep, and I didn't see it specifying whether it was a half-wave or not. Regardless of the fact I DO know how to calculate it or any fraction of a full wavelength.

If the question was "What is the length of a quarter-wave dipole for 14.240Mhz?" or "What is the length of a half-wave dipole for 14.240Mhz?" or whatever then I would have answered right of the bat. Yeah, it is simple to do that formula, but to give the answer would be hard unless you gave ALL of the possibilities such as below:

one-sixteenth wave @ 14.240Mhz = 4.108146
one-eighth wave @ 14.240Mhz = 8.216292
three-sixteenth wave @ 14.240Mhz = 12.324438
quarter-wave @ 14.240Mhz = 16.432584
five-sixteenth wave @ 14.240Mhz = 20.54073
three-eighths wave @ 14.240Mhz = 24.648876
seven-sixteenths wave @ 14.240Mhz = 28.757022
half-wave @ 14.240Mhz = 32.8651685
nine-sixteenths wave @ 14.240Mhz = 36.973314
five-eighths wave @ 14.240Mhz = 41.08146
eleven-sixteenths wave @ 14.240Mhz = 45.189606
three-quarter wave @ 14.240Mhz = 49.297752
thirteen-sixteenths wave @ 14.240Mhz = 53.405898
seven-eigths wave @ 14.240Mhz = 57.514044
fifteen-sixteenths wave @ 14.240Mhz = 61.62219
full wave dipole @ 14.240Mhz = 65.730337

All of the above answers would be correct (barring accidental typos), but the original poster of the question in the first place DID NOT SPECIFY. See, it is important, unless you consider ALL antennas to be exactly one-half wavelength in length.

Hey Mike,

It actually is a good program. A neat function of the program is to be able to create of wave file of whatever is sent, including the text (in morse code) from a text file being sent. Then the wave files can be burned to a CD or made into a MP3.

I have solicited in the past for sample realistic QSO's from people but didn't get much, but those could be completely awesome practice CD's!!!!!! :)

Actually, I have a much more suspicious mind. The government's effort against smoking stepped up greatly in the late 50's, just in time to draw attention away from the health effects of the nuclear weapons tests of that time period. And, amazingly so, the "discovered" negative health effects commonly associated with smoking are almost identical to the negative health effects commonly associated with nuclear fallout (lung cancer, etc.). Amazing coincidence, isn't it? If true, an anti-smoking campaign would be a great "smoke" screen.

The MI Chauffers is one step down from the National CDL thingy as I believe
if I remember correctly it allows you to drive any vehicle 25,999Lbs and
under, as well as tow any trailer under that same weight. For passenger
vehicles, up to 15, otherwise that would require the CDL-C if memory serves
correctly. It also is the same license that covers a "driver for hire" from
anything from a pizza or other delivery person, limo driver etc. I had a
CDL a while back but have not elected to get it again.

Michigan has a specific class, which entails a 6 hour classroom
instruction, a skills driving course (1-2 hours depending on the course,
instructor etc.) and 8 hours driving with your chief to qualify for the
permit. As long as you pass the requirements for this, you can drive
emergency vehicles under emergency and non-emergency official department
business within the state of Michigan. Exception would be if you are
transporting the vehicle across state lines such as if your department were

buying a used pumper from another department in a different state, that
would require a CDL license.......

Yes, it is vandalism, but a simple needle or pin placed directly in the coax
usually does the trick from what I hear. Or take some wire cutters, and
clip the wire, connect the shielding and center conductor of the coax
together and tape both ends back together with black electrical tape would
do the trick as well. Granted, not legal and probably not ethical either,
but the techniques would work in making it a little "quieter."

Same here as well, but the basic would get full privileges except power, limited to 200 watts (who needs much more than that anyways) on only 2 bands, one HF and one VHF/UHF band. At least I remember I had some thought like that.....

Yes and No..... Granted both failing will result in the loss of life, but
at least after the water drains off and everything dries out, you can still
live fairly well if you were one of the sucessful survivors. If a nuke
plant goes to hell, and leaks out a ton of radiation, it's many years before
you can do anything anywhere near the plant.....

years.

Wind is actually a good source, if there is a consistent breeze blowing enough to keep the blades of the windmill moving, and would seem to be fairly inexpensive to construct as well.

As far as solar, the cost of setting up systems are extremely expensive still as the manufacturers of such materials are willing to lower their prices any.......

>
> And let's compare nuclear power to some non-power industries. Are you
aware
> of how devastating accidents at chemical plants can be?

Yes.... Dow Chemical and Dow Corning are my neighbors.... and I am nervous on a daily basis.... From an insider that I know, at of one of those plants that shared this little tidbit of information..... there is 2 specific materials (they wouldn't state which two) were mixed or tampered with the wrong way in storage there that would level Midland County and make it into a crater, and pretty much create extensive damage to Saginaw and Genesee Counties, and part of the Northern portion of Oakland County as well. Makes the human error equation a little more relevant to me, especially if it is a terrorist related activity.

Have you ever seen
> a grain elevator explode from sparks causing the suspended dust to
explode?

Yep, the one I saw blew the top off of the silo, and burned for what like seemed forever!

>
> I'd rather live next to a nuclear power plant than any other type of power
> generating facility or any of several other industrial endeavors.

Not me as much.... would rather see more "natural" forms utilized if it were cost effective. That is the problem.

I wouldn't be surprised if that's not the last event in this story. I smell a 42 USC 1983 issue coming over the horizon (especially for "failure to train" - cf. Monell vs. Social Services of NYC).... He should sue.

I disagree. Identity can be established with the driver's license, and a radio license lookup is no more complicated than radioing in a wants/warrant check on either a person or a registration check on a vehicle. With the data available, "knowledge is in hand."

>So why hasn't California built any oil, coal, or hydroelectric power platns
>in the last ten years?

Some folks would say it's the "NIMBY" problem (Not In My Back Yard), but I say it's actually a "BANANA" problem (Build Absolutely Nothing Anywhere Near Anything). It's not just generating facilities - transmission facilities have the same problem.

>I'll tell you. They too are being blocked by the
>environmentalists.

Are you sure that's the only reason? Are none of the environmental considerations reasonable? Think about how often the ground shakes out there...

> Are they also economically unfeasible? It's unlikely.

No, it's very likely. Here's why:

First, for most of the past 10 years, investment capital has been drawn to the high-payoff telecom and dotcom industries. Until the bubble burst, those were a lot more promising to investors. A server farm can be put up in a fraction of the time that a generating plant requires, with the promise (back then) of a much larger ROI.

Second, the West has a long history of cheap electricity from govt. sponsored projects, most commonly hydro. What dies a typical Californian pay per kWH? Here in Philly, we pay something like 11 cents / kWH residential. NYC folks pay even more. What do they pay in SF or LA? (If the retail is cheap, wholesale must be even cheaper)

Third, the whold deregulation and Enron-type mess has caused anyone with any sense to avoid building actual facilties like the plague, because the market (which used to be one of the most stable and predictable) became completely unstable.

Fourth, the environmental/NIMBY/BANANA effects are greatest and most powerful in places like CA. They definitely play a role - but not the only role.

Larry, I'm not disappointed, but you should be. Talk to Dave sometime
about ARRL award programs. Condensed version: If you don't have all
the cards, you don't have the award.

So you still need to confirm North Dakota for WAS. And the guy in
Qst, 1957-2003, has your 1981-200??? beat.

well, you're analogy is wrong. Last I heard, they are STILL testing people
to get thier ham licences... you STILL have to fill out the correct forms
after
passing the test and pay your fees to get your licence. They are not
GIVING anything away.

you are mad simply because something that you had to do that was very
difficult has been removed for the most part, and may be totally
removed finally due to it's archaic irrelavence.

The process that is required is still taking place, but just not to your
likeing.
That is life, sometimes.

well, then where do you draw the cut off point? if just the small subset of
radio
known as radiotelegraphy is so important to the expansion of radio, then by
comparison, what would you call ALL the other communication forms that
aren't equally represented? why is this small subset of the radio world so
important when it's use is being REDUCED in the non-ham world, replaced
by new communication modes?

>
>
> > For that matter, there aren't
> > profeciency tests in other modes of operation, either, in the
> > form of a seperate practical test such as there is with CW.
>
> Ah, but Morse is the only mode which demands selftraining!

ALL modes of communication require selftraining, just not as strong
as an emphasis on listening-hand coordination to say the least. You
STILL have to train yourself on the rules, codes of conduct, procedures,
information regarding electrical principals and fundamentals (feedlines,
antenna lenght, RF fields, etc.)

once again, it's just that YOU had to do it. That's all.

>Any mope can learn
> any of the others by cracking a book and doing a little hookup wiring.
> With manual radiotelegraphy, there is really no way to do it short of
> selftraining. Thus the CW test.

well, I guess if everybody else is wrong and YOU are right, then it's
just going to such a terrible thing when the CW practical test is
finally, totally phased out.

> > >
> > > When you finally get around to getting a radio that will actually
> > > work on HF, take a listen to the lower end of any band and report

I own a kenwood 850, a 10-15 meter vertical and a 40-80-160 meter
sloper. I transmit and recieve all up and down previously mentioned bands.
Therefore, your statement was unfounded.

>If you refuse to learn how to handle radio's most basic mode you can never
be
>able to regard yourself as fully qualified in ham radio communciations.

okay, time to fish or cut bait... in what way is CW
a building block to the operation of a ham radio
that you can't say about so many other more
modern, up to date and applicable modes?

I mean, ORIGINALLY, the first communication that
was EVER sent was a spark with a spark generator.
The do not require you to show profeciency in building
a spark generator and using it; if you say "well, we just
SKIP that step and go to CW", then you can say that
about EVERY step along the way of learning
ham radio.

<snip>
you just employed the "diversion" tactic. he was totally correct; if the basic fundamentals of radio, which you have been totally parroting until now, required it, then it would be a necissary requirement for all basic electrical engineering, and it is not.

> It's the BASICS, Bill.

As YOU see it.
Why aren't new hams required to show they now how to forge/smelt copper wire, produce polyethelene insulation, make aluminum out of scratch for antennas, etc., if BASICS were the name of everything?

you're mad because YOU had to do it.

3870. where PCTA's fail in logic

Newsgroup: rec.radio.amateur.policy
Date: 2003-09-15 12:53:03 UTC
From: Clint <rattlehead@computronDOTnet>
Message-ID: <vmbdhfc0nr1n86@corp.supernews.com>
Source record: 77435

many people that are in or supports the doctrines of PCTA keeps
spouting "basics", and draws an anology to either handwriting...
and I say this; does this mean you could NEVER write cursive
if you were never taught print? could you NOT be taught
cursive directly without first being taught print? No.

However, it's simply another skill that can be taught, and they
do, and that's fine. However, they do not look at CW the
same way; it's pass/fail, not merely a percentage of test
that needs to be passed.

Do you think they would support a system where you had
to be tested on CW, if an only if you wanted to use CW
on the CW part of the bands? Heh, of COURSE not.
That is where thier anology fails. The art of CW needs
to be tested with a practical test if you are to use and
learn CW, but not necissarily ham radio. I would have
supported a system like that, where if you wanted to
operate CW on the lower half of the band you had to
be tested on if first, but of course, that was out of the
question.

They do not, however, likewise, first test people
on knowing how to build a double sideband carrier
transmission if they want to operate AM; they do
not require you to show how to get a microphone,
talk on it, and recieve the response on a speaker
if you want to use frequency modulated radiotelephone,
or single sideband carrier suppressed radiotelephone.

But they DO want to force CW on people that don't
necissarily have any interest in operating it. "basics"
arguments fail; "selftrained skill" fails because everything
is a selftrained skill, why put the emphasis on an outdated
mode instead of testing selftrained skills on new, modern
modes of communication?

yes, exactly.

I guess it's too bad that there aren't that many coal fired steam
locomotives
being used anymore.

Dwight,

Some time back, I took a *practice* Extra test online. No preparation.
To make it more of a sporting course I did all the math in my head -
no calculator, no scratch paper. Took me about 7-1/2 minutes start to
finish, much of which was waiting for the computer to load the next
question. I think I got one or two wrong, but I could be mistaken
about that.

So it can be done, and I'm no expert or genius, either.

> But, of course, I have serious
> doubts about that claim. In fact, I would consider it almost impossible (and

Did it ever occur to you that his persona here could be an act?

my Speling and Grammer isnt always Perfect eyther, Dwight

> Heck, it would take almost eight minutes for even the
> fastest reader to read over the the exam questions.

Try it sometime. Take an online practice exam and just pick the first
answer that seems even close to right, without much thinking.

> And, considering some of
> the questions in the pool (band limits, etc), I doubt one could pass without
> at least some study (even if the study is nothing more than experience).
>
But if a ham keeps even mildly up to date, those things become second
nature.

And you have to make allowances for Bruce, because according to qrz he's 305 years old.

> People over many generations will have to deal with those waste products.
> And, of course, this environmental polution is far worse than anything
> generated by fossil-fuel burning plants. So, your claim above ("unlike the
> nuclear plants...") is patently false.

Nope. The nuclear plants do not necessarily have to pollute in any
significant way, as there are effective, economical methods for containing
and reprocessing nuclear waste. Once you burn fossil-fuels though, you have
instant pollution injected directly into the atmosphere and the process
continues to generate toxins as long as the burning process goes on. They
end up everywhere.

Shut the fossil-fuel burner down, and it takes a number of years for the
pollution it has already produced to become absorbed into the general
environment. It doesn't just go away, it gets spread around, absorbed, and
dissipated. That would work just fine if there was just one or two
fossil-fuel burning power plants, but the unpleasant fact is that there are
thousands of them around the world. The third-world countries especially
like the "let's burn something" level of technology, because it is something
that they can readily understand, despite being protien-deprived as children
and not having much by way of an education.

Strictly speaking, there is no pollution-free method of obtaining
significant amounts of power. Of the available alternatives, nuclear is the
cleanest and safest by far, and its continued development will eventually
lead us to fusion power. Of course there will always be mindless
chicken-little bleating from those who obtain the latest scientific facts
from Mother Earth News, Cosmo, or the National Enquirer, but if you discount
this fruitcake element, you'll find that most people in the U.S. are
intelligent enough to understand the issues, and can make informed, rational
decisions if you give them half a chance.

Yes, there is a vocal minority who are convinced that the sky is falling. The fact that they get together and agree among themselves does not mean that their hysteria has any basis in fact. It really only means that though they may be wigged out, at least they are not lonely. Taken out of the context of their conspiracy of agreement and placed within a population of normals, they sooner or later find that they are not so sure that the sky is falling after all. - Except for the hard-core wiggees of course, whose only hope would be some form of shock therapy.

Yep, but the online tests are easier. With most of them, all you have to do click an answer directly under the question, not shade a small block on an answer card with a pencil. All that (reading the questions, answers, and filling in the answer card) couldn't likely be done in eight minutes. Of course, anything is possible, so I won't say it isn't (which is why I said it was "almost" impossible). But I suspect you would agree such an accomplishment would certainly be very rare.

> Did it ever occur to you that his persona here could be an act?

Nope. It's too consistent across many newsgroups over a relatively long period of time. If it's an act, he should be in Hollywood.

If that is true, why are there tons of nuclear waste stored around the country at weapons labs, weapons factories, power plants, and so on? Instead of being reprocessed, must agree the stuff will end up being stored in underground containment facilities - facilities to be maintained for many decades or even centuries (at taxpayers expense, I should add).

> Once you burn fossil-fuels though, you have instant
> pollution injected directly into the atmosphere and the

Look, I'm not defending fossil-fuel generator plants. All I'm saying is that nuclear power plants are not a good alternative to fossil-fuel plants - the problems are worse (and potentially catastrophic).

> (snip) Of the available alternatives, nuclear is the cleanest
> and safest by far, and its continued development will eventually
> lead us to fusion power. (snip)

It's only cleaner and safer if you ignore the waste and mining issues, and the potentual for personnel mistakes, design flaws, environmental risks, or parts failure. It is absurd to believe Three Mile Island will be the only serious incident, or the worse incident to ever possibly happen.

> (snip) you'll find that most people in the U.S. are
> intelligent enough to understand the issues, and can
> make informed, rational decisions if you give them
> half a chance. (snip)

Which is exactly why nuclear power continues to lose supporters and this country continues to move away from nuclear power.

Los Angeles has several hundred wind turbines placed in the hills around the area. And, since I saw them getting ready to put some more up when I drove through there recently, it appears they are expanding the program. There are many other areas around the country where such turbines could be placed and the power then fed into the regional power grids (supplying cities many hundreds of miles away). I also saw several experimental solar power plants in Arizona, perhaps feeding power to local cities or the LA power grid. Alternative power sources are quickly reaching maturity.

> authority, namely the FCC.

Son, you might want to learn somewhere along the way that opinion is sometimes congruent with fact, sometimes not.

No matter what the FCC says or does, it can't alter facts. And nowhere have they ever said that a no-code license is a fully qualified ham. In fact, the retired Chief of the Amateur and Citizen's Division of FCC (now called something else) stated in his comments on the NCVEC pettion
(which BTW he helped write) that it was an oxymoron to expect an Extra class ham to be a expert on ham radio if he doesn't know Morse code. Thus he supports a code test for Extras.

And it should be obvious, to anyone who actually owns and uses a thought process - when Morse code is a widely-used mode within ham radio, *anyone* who can't use it simply and factually *cannot* be a fully qualified ham - No matter what license or privileges the FCC gives them.

> And YOU will have to live with the decisions THEY
> make.
>

Which can't change facts. Facts are immutable. Live with it. Any ham not able to operate CW is simply and factually not fully qualified.

Aw Clint, surely you're better informed than that...arent you?

NOTHING has changed about the USE of Morse code, from spark to today's rigs-which aren't simple CW generators, BTW, since you seem to have missed that (at least in the case of most modern rigs).
It's the MODE, the requirement to selftrain to learn to use it, that remains just as valid today as ever.

Of course technical improvements in equipement have enhanced the use of Morse as they have other modes, but the simple requirement to learn to use it remains, as always. FACT!

3881. Re: Keep the cellphone charged

I live in hurricane country (Gulf Coast), and the very first system to go out as a storm approaches is the cell system. It will typically become unusable about 24 hours before the storm is due to make landfall, simply due to overloading. I've been through many hurricane warnings since I arrived in 1986, and the cellular system has NEVER been able to stand up under the increased demand. By all means charge the phone up, but don't expect it to do you much good during the storm's approach or landfall.

The land line system almost goes out too, but if you stay on the phone long enough, you will eventually get a dial tone. Folks who are thinking about evacuating should make hotel reservations now, before all of the rooms vanish and the phone lines become clogged. Guarantee the room now, and fill your car's gas tank now, even if you may decide not to evacuate later.

Evacuate early to avoid clogged highways filled with panicky drivers. Don't be a hero.

Clint your ignorance is showing again. Ham radio isn't about engineering, its about operating ham radio. Sure, one CAN use engineering if one wishes, and someone surely had to do some engineering to produce the gear we all use. But if Bill's comment holds any water at all then the tests would have been becoming harder instead of becominig giveaways.

Ham radio isn't about metalurgy pr plastics technology, Clint, it's about OPERATING . But you amd Bill already knew that, it's jsut your NCI/CB attitudes showing through, again.

> significant amounts of power.

Actually there is, it's just that they have no serious following in the circles where it might matter enough to move things along at a rate which would actually make them viable, available options. Some of them are

Wind
Tidal action
Hydrogen
Solar

What is mostly needed is the emphasis toward development of the alternates. While the isntalled base is fossil fuel, at affordable prices, and the pollution doesn't overwhelm us, not that much is lilely to change. It isn't for lack of possibilities. You could easily generate all your own power now, it's just much cheaper to buy it from a utility which probably burns coal to generate it. You can get engines which will run on used vegetable oil or almost any other type of fat. But few of us will as long as the corner gas station is handy and not outta sight pricewise.

Looks to me like development of hydrogen is the way to go. It's THE most plentiful fuel on the planet, is absolutely non-polluting since combusting it recombines it with oxygen to form water, from which some of the hydrogen can again be extracted. And most current vehicles can operate on it with little modification needed beyond storage. The issue of volatility is actually pretty much a non-issue, considering the volitility of gasoline. Again, it's the insalled base of fossil fuels that would have to be reworked. That's a lot of service stations to alter. And a lot of politics to rework. Not gonna happen anytime soon. No, I haven't forgotten the Hindenburg. Different era, different technology.

There are considerable wind generation facilities in Western areas, though, and I recall driving past a huge solar collector field out there somewhere. .I think it was in southwestern Arizona where the sun shines daily.

And there have been conceptual plans for large tidal action generators for a long time, without any hard plans to move on them AFAIK.

What are the implications if it was, Phil? Most antenna manufacturers market their 10/11m single band models as such. This includes Maco (ex Wilson), Mosley, Butternut, Trident (UK), Max-Gain, Delta X-Ray, and Cubex.

Quote from Cubex:

"These same construction techniques are used in our new line of rugged Quad antennas for the 11M band - The MAGNUM-CB Series!"

Is there a difference? (Other than frequency, that is.)

I think you mean "it will have a concentration of only 1 millionth of
the concentration at *1 mile from* the release site."

If you're talking about long-term exposure from a contained source, I
agree. But when Chernobyl popped, it let off a cloud of radioactive
gas, dust and smoke that spread over a wide area. How much a specific
individual was exposed to how much and what types of radiation and
radioactive material for how long is pretty much anyone's guess.

Plus it's not just direct exposure from one incident, but overall
exposure from many sources. Suppose radioactive dust falls in a water
source, and people or animals drink the water, and ingest the
radioactive material. How chemically toxic is plutonium?

> While specific deaths can't be attributed,

And that's the problem. If someone dies in a coal mine cavein or
downwind of Bhopal, it's attributed.

> the overall
> numbers can be assigned by simply comparing the death rate due to leukemia
> in the affected zone to the death rate outside.

Ah - but what constitutes the affected zone and what constitutes
outside? How do we know the control group wasn't exposed from other
sources? Heck, there's americium in smoke detectors...

> This can be done for each
> cause of death that can be increased by radiation. If society wants the
> data, it can be gathered.

It should be gathered. But the results may not be pretty.

> But people would rather hide behind the emotional
> fear of possible problems than researching what problems will occur and the
> magnitude of the problem and making an enlightened decision.

To a certain extent, I agree. But it's not all emotions - it's also a
matter of judgement, trust and education.

Look at the links Mike Coslo posted about Navajo uranium miners. Would
you work their jobs? Can you say with any degree of certainty that
none of their deaths or disease are due to exposure to uranium ore?

Most of all, will any of their deaths ever be attributed? Probably
not, because we don't know how much of that uranium went to make fuel
rods.

"Society" and "the public" were told for decades that nuclear energy
was "the future" and was safe, clean, and would be "too cheap to
meter". We were all supposed to trust the govt. and the industry, but
those folks make mistakes too. Is it any wonder people are not willing
to accept such promises at face value any more?

Perhaps the biggest problem is education. Most people have only the
vaguest ideas about how electricity works, let alone how it is
generated and transmitted. Yet they are expected to accept on faith
that nuke plants *and all the rest of the nuclear industry* are safe.
Until people are educated to how things really work, you're just not
going to get that kind of trust.

>
> Still, stupidity can't be allowed to stop us from facing the energy needs of
> the future.

It should give us pause about what technologies we use to face those
needs. For example, look at Palo Verde, the newest US nuke plant,
which became operational in the mid '80s.

How much did it cost to build per kW of capacity?
How much has it cost to run per kWH since it started up?
How much will it cost per kWH to dispose of the waste, ranging from
very low level stuff to used fuel rods?
How much will it cost per kWH to decommission when its useful life is
over?

Now compare the answers to those obtained from, say, a wind turbine
plant.

> Instead one addresses the issue and error proofs and mistake
> proofs the facility.
>
Except that it is *IMPOSSIBLE* to error proof and mistake proof
anything that involves humans. The whole history of technological
goofs proves that simple fact again and again. There is *always* a way
for people to mess things up.

Remember the Titanic? "Practically unsinkable" was the description.
OOOPS...

Titanic's sinking was due to a long chain of human errors, not
technological ones. She wasn't even new technology, and her crew was
experienced. Sister ship Olympic was the first of that class, and much
of the Titanic crew (including her captain) was simply transferred
from Olympic when Titanic went into service.

Of course people didn't stop building steamships after 1912. But
neither did they call *any* ship "practically unsinkable", either.

We can make technology safer, but it can *never* be 100% safe. So we
have to understand the risks, and utlimately decide which risks are
worth taking. And when an industry asks millions of people to live
with a certain risk, it is to be expected that different people may
not accept certain risk factors. Because it's *their* lives and
property.

> Nuclear technology is not complex. It's relatively simple in fact.

Old joke:

First banana: "Life is strange"
Second banana: "Oh yeah? Compared to what?"

When you say "Nuclear technology is not complex. It's relatively
simple in fact.", one has to ask "Compared to what?"

I would dare to guess that the Peach Bottom nuclear plant is far more
complex than Holtwood or Conowingo dams (all three are on the same
river, within 100 miles of here).

> > >Nuclear power generation has been round for 50 years now. A total of 34

Hmmm??

I don't know of a single case of such a disaster in the USA in my
lifetime.

> > >And speaking of long term environmental impacts, what about thousands of

> >
> > Sure. But not as significant as the effects of radioactive materials that
> > take millennia to break down.
>
> Not proven.

And that's the problem. We do not know the long term effects of the release of radioactive stuff into the environment. Particularly the effects of the release of elements like plutonium, which do not occur naturally at all.

> Millennia worth of acid rain could conceivably be just as
> harmful as the time taken to breakdown radioactive materials. Why? Because
> even though the acid rain dissipates, it keeps on coming down year after
> year.

I think you're grasping at straws, Dee. The acid from acid rain will break down far faster than many radioactive debris will decay.

> > Consider just one spent fuel rod from a nuke plant like TMI. How long
> > before it is harmless?
>
> Let it be reprocessed and recycled and it's not a problem.

You're avoiding the question. How many years?

As I understand it, (correct me if I'm mistaken on this) such a rod starts out as contains uranium, plutonium and some other fission products . Reprocessing extracts the usable uranium to make new rods - but the plutonium and other fission products are not usable in current technology power reactors. Plutonium can and is used in weapons, however, which is why the Bush administration is so interested in other countries' nuke programs. Like Iran.

IIRC, there's only one operational reprocessing plant in the world, and it's in France. And there are far more spent rods than it will ever be able to handle. On top of which, the rods which do result are more expensive than new ones.

When you add in the cost per kWH of reporcessing rods, what happens to the above cost evaluation?

> > >So if an honest evaluation and comparison of long term effects, deaths,

Ah - but you made the statement up front that nuclear would win the comparison. That sort of thing makes folks distrust the industry that much more.

> My point was that people are refusing to even consider the

How much do they pay per kWH, residential?

> Costs are being absorbed by the state government
> instead of being passed to the users and it's wrecked the state budget. It
> looks like those contracts will be canceled and California will be right
> back to their brown outs and black outs.

Because they made some really dumb decisions about "deregulation".
They treated electricity as if it were the same as any other commodity
- which it isn't.

> > >Now let's take a look at serious industrial accidents. A prime example

> Long term radiation exposure thus becomes a non-issue.

WHOA!

That's *ENTIRELY* the issue!

As long as TMI is contained, it poses no hazard. Just like there was
no need for lifeboats on the Titanic until it hit the iceberg...

How long must it be contained? Decades? Centuries? Millenia?

How long can the containment building be expected to stay tight, while
its radioactive contents decay?

Who gets to pay for that containment and monitoring?

Will there *ever* be a way to safely dismantle it?
>

Actually, some disposal of those chemicals is being done. PCB
transformer oil in particular.

For what - weapons? Are there any operational US power reactors that
will run on plutonium?

And again you've avoided the question - what's the half life of
plutonium?
>
> > And if you're going to discuss dangerous industrial processes, consider

True - and the opposite is true.

> Mankind is a
> rationalizing animal. We will find justifications for our wants and desires
> and fears whether there is any basis in fact for them or not.

And that goes as much for the folks who support nuclear power as those
who oppose it. You say you'd rather live next to a nuke plant than a
hydro dam, but can you point to a single case in the past 50 years
where a US hydro dam failed and killed people?

I hate to be the one to break it to you, but these matters are not really determined on the basis of a popularity contest, as you appear to believe. All of the alternatives you have listed have their drawbacks, and fall into third-weenie position on the basis of their merit (or lack therof) when compared to other systems, and not on the basis of advocacy. Office politics has very little to do with these matters. To assume that it does is unfortunate, because it prevents you from taking the facts of the matter seriously.

Of those four, only solar power has any potential for widespread use, and potential is about all it has right now. It is still 'way too expensive. People have been hearing about how solar is going to be affordable in "just a few years" for several decades now, a good indicator of the verity behind most of the solar folks' claims. Because of these bogus claims, it is getting harder and harder to find funding for development of solar. - And because of that, in turn, the day of affordable solar power has been pushed even further down the road.

So in a way, I suppose that advocacy can have an effect on the progress of research... In the case of solar, advocacy by enthusiasts has undermined the progress of the researchers and scientists through thier mindlessly inflated claims and protocol war behavior in regards to alternatives. Though the behavior seems perfectly reasonable to the advocate, it is offensive to the

people who actually do the work that brings us forward, and makes it more difficult, not easier for them to obtain funding.

It "feels good", but is counterproductive when you "do it".

I. you're not my father, do not call me son.
II. the second part of your remark has not the slightest shred of relavance
to anything.

>
> No matter what the FCC says or does, it can't alter facts.

You are so correct. However, what it DOES is make rules and laws. Therefore,
if they make a rule that code practical tests are no longer valid nor
necissary
to aquire a ham radio license, then the bottom line is that there will not
be
any further code tests. It is YOUR oppinion that somebody is not a fully
qualified ham without code testing. It is FACT that they are a fully
qualified
ham in the eyes of the FCC if they meet all the requirements the FCC sets
forth; now, THAT is a fact.

And nowhere have
> they ever said that a no-code license is a fully qualified ham.

excuse me? then what is the little piece of paper your issued with a
callsign
when you meet all the requirements set forth by the FCC to acquire one?

In fact, the
> retired Chief of the Amateur and Citizen's Division of FCC (now called
something
> else) stated in his comments on the NCVEC pettion
> (which BTW he helped write) that it was an oxymoron to expect an Extra
class
> ham to be a expert on ham radio if he doesn't know Morse code.

and that is the RETIRED chief's oppinion.

the oppinions of the current members of the FCC are what counts. Not his.

Thus he supports
> a code test for Extras.

and he's retired, and no longer a voting member of the FCC.

> >
>
> Which can't change facts. Facts are immutable.

yes, like it is a fact that the FCC makes the laws regarding the
use of ham radio bands and the requirements to do so. NOT
retired members.

Live with it. Any ham not able
> to operate CW is simply and factually not fully qualified.
>

that is your oppinion.

I tell you what; next time you're operating a motor vehicle, drive
as fast as you can... I mean pedal to the medal; do over 100mph
if you can. when a policeman pulls you over and hands you
a ticket, then tell him "I am driving at a perfectly safe speed for my
skills. Your oppinion and that of the judge that I am about to have
to go in front of are not relavant. It is an immutable fact that
a driver is not a good driver unless he can do 100 without wrecking,
which I did. That's a fact, and you can't do anything about it."

and just see what happens.

Clint

He is either referring to a half wave dipole or is just plain mistaken.

Here is a page that explains many different types of antennas

http://www.packetradio.com/ant.htm#hfcut

Lots of good design aids there. And the dipoles are half wave long.

> From
> http://www.wr6wr.com/newSite/articles/features/olderfeatures/antennaswithtwist.html
> . . ."The shortest self-resonant linear length of wire is not the half-wave
> dipole as one might mistakenly assume, but instead, a wire one quarter of a
> wavelength long."

First, I'm assuming he is talling about a single wire, not a dipole.
Big difference.

> and . . ."On-the-air tests on 2 Meters with KI6O

Then it isn't a so called 1/4 wave dipole any more. Sounds to me like
his "spiral coils are loading it.

> From http://www.oakvilleamateurs.net/newsletters/hb200302.pdf
> . . ."For most 40-meters, the most practical antenna is the 1/4-wave dipole
> (66 feet in total length) up at least 33 feet in the air.

He's right on the length. He's wrong on what he is calling it. he is
describing a nice half wave dipole. The diple is a 1/half wave antenna.
The confusion is probably brought about by each leg of the dipole being
1/4 wavelength long.

And yes, an antenna can be put up that looks something like a dipole
but really isn't at the wavelength a person is working at. This is
usually referred to as a general purpose dipole. This is fed with
balanced, or ladder line, and matched with an balanced tuner.

I think it's an act, invented for the purpose. But even if it's not an
act, the written tests are not spelling or grammar tests.
"Intelligence" isn't a single-dimension quality. A person can be
brilliant in one area and have serious developmental problems in
others.

In fact, if you deny that someone who writes like Bruce could ace the Extra written in eight minuites, then, by the same logic, you have to deny the claim that someone could be brilliant in electronics but have a difficult time with 5 wpm Morse Code.

but i think its all a act He puts on

The question refered to a DIPOLE. A dipole is at least 1/2 wavelength
long.

See comments by Jeffery Herman for further clarification on a 'dipole'.

OK, fine.

But why should any sort of manual writing skill be mandatory in a
world full of keyboards?
>
> However, it's simply another skill that can be taught, and they
> do, and that's fine.

Why?

Why not teach keyboarding from Day One? Our children will spend far
more time at keyboards than writing.

> However, they do not look at CW the
> same way; it's pass/fail, not merely a percentage of test
> that needs to be passed.

If it were up to me, there would be several written tests (or the
written would be split up into separately-graded parts) as well as a
code test.

> Do you think they would support a system where you had
> to be tested on CW, if an only if you wanted to use CW
> on the CW part of the bands? Heh, of COURSE not.

There are no CW-only parts of the HF/MF bands. None at all.

> That is where thier anology fails. The art of CW needs

> modes of communication?

Then answer this question: Why should people who are not interested in building or fixing their radios have to learn all that theory stuff for the written tests? Why are all hams tested on all sorts of stuff they are not interested in?

When I first started out in ham radio, all I wanted to do was join the folks I heard on 75 meter AM. Yet in order to get the license, I had to learn not only Morse Code, but all sorts of theory and regulatory stuff that had absolutely nothing to do with 75 meter AM.

Why was I forced to learn all that?

Where I used to work they did the 2 week paycheck game, only on
Tuesdays. All paychecks were the same, but while most months had 2
paydays, some months had 3. We called them "Magic Months", and waited
for them in a BIG way! Almost all years had 2 Magic Months, but a few
had 3.

> was!?

With Isable on the way I'm gald I don't have big antennas.

But a 3 el 10 meter quad is hardly "big" in these parts. How about a full size 2 element quad for 80 meters? There was one only a few miles from here. I saw it with my own eyes - and the rest of the Yagi beams on that 100 foot tall tubular steel rotating tower. IIRC, there were something like 3 elements on 40, 5 elements on 20, 5 elements on 15, 5 elements on 10. All monobanders, too.

Good luck with the house.

Now, now, Rev. Jim, I'm not going to do your google searches for you.
But there's a couple of them in there for Len, and a reversal - Carl
censured me. He asked me to go easy on one of your bunions.

I'm suprised. It's not OK, yet you didn't edit out "retarded
mouth-breeding NCI members."

I really don't know. Thank heaven they've gone a long way to fix
the problem, and may make the final move here soon to remove the
scourge of CW tests all together.

Here on the texas gulf coast we've had several
tropical storms over the last couple of years....
while the storms weren't that destructive
(thank God), in each case there was a loss of power.
My cell phone was the only thing that wound up
working (I was suprised the towers didn't lose power).

My mistake was not getting a seperate 12v power source
for my transcievers, though, but by the next hurricane
season I should have the problem rectified.

That is GREAT, but if only the federal courts would
take up the fight against states passing laws against
private citizens having radar detectors, when
there aren't suppose to be any bodies of
governement on any level passing laws regarding
the airwaves except for the FCC.

They kinda left not just hams but all of the people
as a whole out hanging to dry on this one.

Sorry.

The tested material is insanely technical and the privs are insanely
high for an entry level license.

Go do some historical research and see what the Novice material
consisted of, pre-Novice Enhancement.

Now that's an entry level license.

Wonderfl, then you'll learn code if you want to participate there.
If not, nothing lost. More to the point, is there any minimum code
speed that should be banned from the CW/data segments at the
bottom of the bands?

Cheers,
Bill K2UNK

So far the UK, Netherlands and several other countries have done
exactly that. Once all code testing is ended by the FCC will you
accept that action as supporting the FCC position that
morse isn't needed to be a "fully qualified ham?"
Additionally, I don't recall anywhere seeing any FCC reference
to the concept of a "fully qualified ham". Is that a new license
class?

> In fact, the

What a crock. On that basis, if you can't speak Spanish, Chineese, and several
other languages commonly used by hams around the globe, then you
shouldn't be considered "qualified" either.

> > And YOU will have to live with the decisions THEY
> > make.
> >

Hmmm ... once the winds pick up to about 50 MPH, the cell phones will be a jingling 911 to ask "is this the hurricane?".

By the time the winds are up to 60 MPH, a lot of cell phone users won't be able to get through due to so many calls to 911 asking "is it going to get worse?"

Once the winds have reached hurricane force, some towers will be down and most calls won't get through. Many cell phone users will be trying to call friends/relatives to let them know how they're doing. This is an *excellent* time to call your girlfriend/boyfriend (for teenagers, of course) to give them a minute by minute description of the junk flying past your picture window. Don't laugh; when I was on Guam and a typhoon hit, one idiot went out with a new motion picture camera (this was before video tape) to take pictures of debris flying through the air! (yes, it's true)

Keep the batteries for the flashlights, unless, of course, you've got a couple of HTs to use 'em in :)

Let the cell phone users tell me how reliable they are *after* the big blow hits.

Come on Jim. that's a self fullfilling argument. My point, and I know
you know this, is that morse knowledge is not needed in any manner as
a foundation, stepping stone, or whatever to any body or radio knowledge
or concepts.

> Although other
> services have pretty much stopped using Morse Code, hams use it
extensivley,
> and an amateur license is permission to operate an amateur station, not a
> station in another service. Note that the Morse Code tests are at a very
basic
> level. They're entry-level, nothing more.

Are you afraid that without a code test, people will "pollute the HF
airwaves"
with bad morse?

> Second, if someone wants to actually design and build radio equipment,
having
> skill in Morse Code permits them to use almost anything from very simple
to
> very sophisticated equipment to good advantage. Would you expect a
newcomer to
> radio to build an SSB transceiver as a first project?

They can build whatever they want. If they want to start with a simple
morse
Xmitter then they will learn at least enough morse to be able to use it.
If they don't self train themselves, the rig will be useless to them. As
another
point of reference, when I was going for my AAS in electricl technology we
built a 10 watt CW rig as part of the lab work. We tested it using a dummy
load and no one had to know even one character of morse to do the lab work.

> >now, the electrical principals of what a CW

Tat is ONLY if one wants to operate telegraphy....which is NOT
an FCC requirement at all (i.e. there's no FCC requirement that
any ham be operating proficient in any mode).

> It's the BASICS, Bill. When you can't appreciate the fact that
radiotelegraphy
> is radio at its most basic it's no wonder
> you can't understand the concept.

When you can't accept the fact that there's no mandate for anyone to ever
use morse code or any other mode, then you'll never get it.

> The entire point is that radiotelegraphy using manually encoded Morse
remains
> as one of the most, effective, and COST EFFECTIVE means of
radiocommunications,
> even after all the years it has been in excistence. But only when
operators
> self-train to gain the skill to use it.

Which any ham will be free to do (i.e. self train in morse) after code
testing is ended. Those that want to use morse will learn it. Those that
don't, won't. That is the same for every mode and/or language
(both written or spoken) used by hams anywhere.

> The FCC has every reason and more than ample justification to require
EVERY
> ham to be able to actually pass traffic in Morse on the air.

Guess I must have missed the FCC report that acknowledges that.

> It's easy to make
> a case that the ability is a valid requirement for licensing.

So far your success with the FCC has been zilch in doing so.

> The fact that
> they have not chosen to do so is far more related to the wants and desires
of a
> vocal few, and a whole lot of PC, than the actual operational
traffic-handling

Now who is crying in their beer?

> Now you'll come back with the same old saw about how it's "no longer
sued" for
> this or that.

It isn't a matter of use...those that want to will learn. It's
that freakin simple.

> Just as though no such need will ever again present to the ARS,
> ever, under any circumstances. Whatta crystal ball jock you are!

Yes, let's mandate morse for all just in case the Aliens invade as
in Independance day.

Cheers,

Ya can't operate any locomotive if yer not certified "in type" per
(+/-) the FAA regs for being licensed in type of A/C. I forget who
issues the certifications, the states or the feds. Plus the ASME also
gets into the act in the case of steamers because of requirments on
certification of boiler operators. Which is not the case with diesels
and full-scale Lionels.

Then you agree that the skills tested for should be those actually used.
>
>I guess it's too bad that there aren't that many coal fired steam
>locomotives being used anymore.

They had their good and bad features.

The main reason most US railroads stopped using them in the 1950s was simple economics, nothing more. The total operating cost of diesel electric locomotives, in terms of ton-miles per locomotive operating dollar, was simply better. The diesels themselves were more expensive to buy, and so was their fuel. Parts were also more expensive. But the diesel-electrics did not require water, did not generate ashes or cinders, and could be left idling in cold weather without much attention.

US railroads then were (and most still are) private companies whose purpose is to make a profit.

Ham radio is completely different.

>outta sight pricewise.

There's also efficiency considerations. More efficient lighting methods and
insulation can make big differences. The effect of requiring an efficiency
rating of 12 on new air conditioners instead of 10 is enormous at the power
plant.
>
> Looks to me like development of hydrogen is the way to go. It's THE most
>plentiful fuel on the planet, is absolutely non-polluting since combusting it
>recombines it with oxygen to form water, from which some of the hydrogen can
>again be extracted.

But where do we get the hydrogen to begin with? It does not occur by itself naturally on earth in significant quantities.

To extract hydrogen from water requires electrolysis, which requires electricity. The energy available from the extracted hydrogen is no greater than the electrical energy required to extract it.

Extraction from methane (natural gas) leaves you with a lot of carbon to dispose of. And you might as well burn the methane.

>And most current vehicles can operate on it with little
>modification needed beyond storage. The issue of volatility is actually
>pretty
>much a non-issue, considering the volitility of gasoline.

Gasoline evaporates but hydrogen would have to be stored under significant pressure.

>Again, it's the

>service stations to alter. And a lot of politics to rework. Not gonna happen
>anytime soon. No, I haven't forgotten the Hindenburg. Different era,
>different technology.

Recent tests have shown that what caused the Hindenburg disaster was that the fabric covering was extremely flammable. Analysis of fabric scraps and the famous film has shown that the skin caught fire first, and ignited the gas inside.

Hydrogen isn't an energy source. It's really just a storage method.

No! Let me explain...

The old code test worked like this:

The examiner gave you a yellow lined legal pad and a #2 pencil. You put your name at the top of the copy sheet and got ready. You put on a pair of 'phones and when everyone at that test table was ready, the test was started. The test was 5 minutes of plain-language code at the required speed (13 or 20 wpm - back then only volunteer examiners gave 5 wpm tests)

Your job was to write down the code as received. When the code stopped, you had to put the pencil down IMMEDIATELY. No going back and fixing anything up, no filling in missed letters even if they were obvious, etc. The examiner pulled the pads away as soon as the code stopped, sometimes resulting in a long pencil mark down the page...

The examiner had to find at least 1 minute of solid copy for you to pass. That meant at least 65 correct legible consecutive characters for 13 wpm or 100 correct legible consecutive characters for 20 wpm. "Legible" meant HE had to be able to read them easily the first time - no "what's this?" from The Man. If the examiner could not find the required 65 or 100, you failed. 64 or 99 wasn't good enough. Go home and study for at least a month before retesting.

If you passed receiving, then you could try sending. You sent what was written on a laminated card that the examiner gave you. He was sole judge of your sending skill - he could decide you were OK in a few seconds, or keep you pounding away for a couple minutes. (It was rare for a sending test to last more than a minute). You had to send at the required speed, too - he would tell you if you were going too slow. If you failed the sending test, you had to go home and study for at least a month before retesting - both sending and receiving. I don't know anybody who failed sending, though.

You were allowed to bring a mill for receiving and speed key for sending, but you'd better be well-prepared if you showed up with same.

If you got that far, they'd give you the written test. After 1960 they were all multiple choice, but we did not know the exact Q and A, just general subject areas. The FCC published "study guides" in essay format. These were reprinted with permission in the ARRL License Manuals of the day. You were also expected to know the regulations (which were not part of the study guide questions).

You had to get a certain number of questions right (74%, as I recall) on the written to pass. Miss by even one question less than the required and you had to go home and study for at least a month before retesting - both sending and receiving code, and the written. No do-overs, no credit for tests already passed. All or nothing at all.

Usually they would not tell you how well you did other than "Pass" or "Fail". They did NOT tell you which ones you got wrong. (At least not in Philly).

When I took the tests in 1968 and 1970, there was a fee of $9, IIRC. I'm not sure - the fee was instituted in 1963 and was $4, then $9, then $4, then eliminated. The fee was the same whether you passed or failed. Only the Novice was free.

$9 doesn't sound like much but back in those days it was a lot of money for a high school kid. I think minimum wage back then was $1.20 or so, which meant the test was a days' pay BEFORE taxes for a minimum wage person. And a kid would have been glad to get minimum. I estimate that the equivalent today would be $50-60.

The 2 year experience requirement for Extra meant that most hams needed to make at least two trips to the FCC office to get the top license.

For those of us near an FCC office it was mostly a matter of getting off from school or work. The big offices held exams one or more days a week.

For those farther out it was a much bigger deal.

What all this did was to cause prospective and upgrading hams to be extremely well prepared before even attempting the trip to FCC. Today they would call it "overlearning".

Was it a better system back then? You be the judge. It's not coming back any time soon. And it wasn't hams, new or old, who changed it.

First time I tried 13 wpm, I did not pass because the examiner could not easily read my longhand. Which had been pounded into us by the penguins (oops, I mean IHM nuns).

So I went home and taught myself to block print. (Printing was not a parochial school subject - only "publics" were allowed to print. Something about being bold, brazen articles was involved). Next try, later that summer, I had no problem.

It may well come to that. For now, since keyboards are not
everywhere 100% of the time, educators require some
sort of manual writing ability. For the record, I never had a
decent handwriting and I print everything on those rare
occasions when I have to manually apply pen to paper.

Excellent point.... yet another reason why specific code speed testing
is irrelavent. AND, for that matter, it leads to the next argument...
what of those people that have true disabilities and cannot pass a
CW test, and have a physician's written excuse, when they had faster
than 5 wmp testing? they were NOT required to take a 13 or 20 wpm
test... yet, somehow, they were accepted into the world of ham radio
as legal operators. How is it POSSIBLE that they did this without
having ever passed a profeciency test @ high speed CW?

Oh, that's right. Because it's not really that necessary in the first place.

Yet another voice of reason. And there are more of them out there
on this side of the argument than the PCTA's.

I'm use to it.... it's the same thing I run into in other newsgroups during political debates. As soon as "the other side" runs out of arguments, I start getting the following remarks, and in no certain order...

s__thead
hatemonger
shut the f__k up
fascist
moron
why don't you take a _____ and shove it _____ until you _____....

...plus a few other directives instructing me to take objects and do things with them with certain parts of my body, most of which aren't physically possible but are quite colorful.

> (both written or spoken) used by hams anywhere.

exactly. I will continue to use CW from time to time, even after all
code testing is gone. I like it. I enjoy it. However, I still see no further
logical reasoning for forcing everybody to become profecient at some
given "x" speed.

it's just more "I had to do it, so waaaa waaaa waaaa, YOU should have
to!"

>
> > The FCC has every reason and more than ample justification to require
> EVERY
> > ham to be able to actually pass traffic in Morse on the air.
>
> Guess I must have missed the FCC report that acknowledges that.'

it's because it's just his oppinion.

>

>
> It isn't a matter of use...those that want to will learn. It's
> that freakin simple.

like I said countless times before... when they are posed
with the question, "well, how about only code-testing for
people who want to go on the lower (code) end of the
bands and operate CW?" (since, in fact, you WILL have
to learn CW to operate it anyway) boy do they run, play
duck & cover, and dodge the issue. Nah, they want it
imposed on EVERYBODY.

Now's what was he saying about legislation by "a vocal
few"?

> Yes, let's mandate morse for all just in case the Aliens invade as
> in Independance day.
>
> Cheers,
> Bill K2UNK
>

how about that fabricated story a while back involving the russian submarine..... there were lots of PCTA types taking a little artistic license with the news and saying that the russian crew was tapping on the wall of the sub, and those messages were getting through. (the story of the sub sinking wasn't fabricated, only that there were supposedly CW signals comeing from it by way of tapping)

seriously. I can't remember if it was this newsgroup or another, but I remembered saying to myself, "now they've gone to a very SHAMEFUL level...."

Ooooh, huge, huge miscalcualtion, Brock. You give these guys way too
much credit. These guys have memories like an elephant, and they will
carrry the debate to their graves. Which is why I say that the only
cure are the actuarial tables. They are as unyielding as the PCTA,
till the bitter end.

The Smith Chart could be folded into any current examination. But,
no, you want/need/can't live without a separate pass/fail exam that
will intimidate people and keep them from the ARS.

"The ARS isn't for everyone."

All sounds sensible, but the month before retesting thing seems a bit
obsessive. I can understand not retesting the same day, but not a month
wait.

Now here is something that seems has been improved upon. If there are
going to be different elements, it makes sense that if one element was
passed, that you don't have to be restested on it. I had to test for my
General twice because I flunked element 1 the first time. I passed the
writtens, I would have passed them again. Not muchpoint in wasting the
VE's time.

Regardless of the Morse requirements or the test contents, the testing
system was not superior at all IMO.

Interestingly enough, it would appear that matching up what was
happening in the country at the time this was happening, the FCC tester

(government) was replaced by the VE's (non-profit, but certainly private sector. The changes in the tests might seem like a de-regultion type of move.

I guess I'm not going to blame the liberals for this one....

Clint, first, DICK is in Missouri. Second, he used to drill 7/8"
holes in the rooftops of police cars. He probably can drive 100+
miles an hour, yet never even have to see a judge. That's just the
way things are in Missouri.

And don't try to tell him anything about the FCC. He used to know a
guy that used to work at the FCC, so he knows all about it. Past,
present, and future.

Not to worry. The actuarial tables will solve all. They may be
painfully slow, but huge corporations have lots of faith and money
riding on the fact that they are immutable.

Yep, in a nutshell. When the gubmn't said, "Jump!" DICK replied, "How High?"

Now he feels foolish.

I'm pretty sure that was done to keep down any not-ready types who would have showed up ever day to test yet again, until he finally lucked into one. We used to get a bunch of that at the VE sessions. Was a pain trying to refrain from giving them the same written and code tests they had already taken and failed (against rthe rules) Made it necessary to keep a file on failures including the coding of the tests they had already failed.

And as Jim said earlier, the FCC used a more limited set of tests. They had only a few opf each class. That alone was reason to "urge" applicants to be more ready to pass. They weren't into non-serious stuff, for obvious reasons-it made more work for them.
Doesn't bother them how it goes with the VE's.

Dick

Now, now, it wasn't all THAT bad! I take advantage of
whatever ham radio offers me NOW, and remember what it was like back in
1967. Yes, we had tube trans-
mitters and a trunkload of cables, relays, dynamotors, and back breaking
sets that I couldn't even heft now, but
it was still fun. That's because we didn't KNOW any better. Had you told
me in '68 that we would have radios
the likes of the 706, I'd have chortled "no way". There were none of the
Analyzers and we used grid dip meters,
amp meters (to measure antenna current), and even florescent light bulbs for
"instruments". We still had fun!
I was a CAP member in those days, not a ham yet. Ever
since I was a kid, I listened to my Dad's 1940s Philco
shortwave set--Mom used to say it made a great babysitter because I would
sit for hours and try to tune
in those "Donald Duck" sounds, and not understanding why I could not tune it
in. I didn't know what a BFO was, but I was still fascinated with it. I
got the crap
shocked out of me with capacitors and plate current and
dynamotors (and survived), And I had fun. The license
was not quite convenient when in high school because my
family tended to live out in the boonies and Dad had no interest in taking
me to a Field Office to take the test. There were no hams around in the
middle of nowhere where we lived. Still, I learned, made mistakes, and
and had fun. Got a lot of "education" with CAP, and
eventually got my ticket in '89 after I was grown and married. I had a lot
of good elmers in later life and learned also how NOT to shock the stuffings
outta me. And I

am still having fun! The goofballs I encounter I just ignore
and don't get dragged into cuss fights and infantile behav-
ior. Because I was trained as a CAP radio operator before I got into ham
radio (I was very aware of it, BTW), I tend to operate in a more structured
manner. I can have a ball chatting with friends and experimenting with
projects. Suffering a fool with a radio that gets his
jollies kerchunking repeaters and QRMing HF QSOs is
not for me!

I just enjoy what I have now, marvel at the tech advantages that seemed
impossible in the '60s and remember fondly those old glow-in-the-dark rigs
that seemed so "right" way back when..... But it wasn't THAT bad! LOL!

Babble, babble, babble & rave on! Brainiac, the Village Idiot at his finest!

BTW how would YOU know what size hole goes in the roof of cars?
You beern there and done that, hey??? And since you DON'T know, not a single one of our cars used
the rooftop for antennas. Beyond that, all the installations were done at a central radio shop, not
by field engineers.

You sure are a fart smeller!

Hey... you really want to watch that rush hour trafic, now. Those tables you're so sure of might
catch up with you a bit early, you know.....Happens every day. *I* made it through those days
intact......

Bilge. All of it. A 66 foot dipole is roughly a *half wave* dipole on
40M and a 134 foot dipole is roughly a *half wave* dipole on 80M. A 33
foot long center-fed dipole is a quarter wavelength long on 40M but it
is not resonant on 40M and ya better not get stupid and feed it with
coax then just plug it into the back of yer radio if ya wanna work
anybody with it.

Ask any Novice . . .

No need to get fancy on that. For the PL-259 "UHF" type connector,
just do one winding of transparent tape around the male pin. Gives it a
hard-to-see insulator when mated. [old Signal School trick...:-)]

Dwight, I worked on Solar One in Barstow, CA, the first large-scale solar-furnace electric plant in the middle desert. Rocketdyne built the boilers (out of rocket engine material) and the thermal storage unit that stored heat during the night. MacDac of Huntington Beach was the system prime for a group of local utilities as a pilot project.

Solar Two replaced it, trying out more things in re solar power as heat. The two plants put about 50 to 100 MWe into the grid (as I recall). A small part of the GWe required by the region.

Tsk, tsk, tsk...typical non-amateur-radio diversionism going on...by an easterner trying to dump on the most populous state in the union.

According to a number of local newspapers (we refer to 1.4 million daily issues as "local"), California HAS built power plants (not "platns") in the last ten years. Fossil fuel types, too.

According to a bunch of ignorant easterners, California is supposed to have an "energy shortage." It doesn't. What it did have are some unscrupulous energy suppliers who played fast and loose with state government regulations and have been investigated extensively since all those "rolling blackouts, etc." of two-three years ago.

Here in the middle of Los Angeles, the Department of Water and Power has NEVER had to resort to any "rolling blackouts" or other nonsense. Electric power keeps flowing nicely at slightly less that a dozen cents a KWHr electric to residences.

Last time my area suffered a major power outage was during the Northridge Earthquake of 17 Jan 94...a MHV tower collapsed, causing the whole 10 to 12 million service area to trip out and go black. It was back up by noontime
with a Black Start underway that was completed by nightfall.

"The Environment" and electric power plants aren't really an amateur radio issue, are they? During the 17 Jan 94 Northridge quake the area lost ALL electric power for a while. Oddly, NO amateur radio nets were springing into action during a sudden emergency. Why was that? No ARRL reps on hand to write them up? :-)

>they ever said that a no-code license is a fully qualified ham.

The FDA qualifies ham, senior.

The FCC does NOT use the term "ham" in Part 97. That's the LAW.

For NEW amateur radio licensees, the FCC "qualifies" radio amateurs in
three license classes. One of those is the "no-code-test" Technician.

>In fact, the
>retired Chief of the Amateur and Citizen's Division of FCC (now called
something
>else) stated in his comments on the NCVEC pettion
> (which BTW he helped write) that it was an oxymoron to expect an Extra class

>>transmission is, and a knowledge test of that is a good idea, but
>>that's comparing apples and oranges.

Comparing apples and oranges is fine for the produce market, Rev. Jim.

>Why should there be *any* written test on theory if all a person wants to do
is
>operate manufactured radios? If someone doesn't want to build a rig, why
should
>they have to memorize all those symbols, diagrams and formulas?

Well then, you WANT type-accepted radios in amateur radio?!?

Why would you WANT such a thing?

>>I think most of the PCTA
>>is being disingenuous when they come up with "good reasons"
>>to keep CW testing alive;
>
>Why?

You've been GIVEN all the "whys" you can possibly handle.

Maybe you are suffering from "information overload" and can't accept
all those valid reasons?

>> I think the true deeper reason lies
>>somewhere in the "I had to do it so everybody should" relm,
>>as i've stated before.
>>
>You can think what you want, but you're mistaken on that account.

Nope. NO ONE is "mistaken" on that account.

You WANT an exclusive Archaic Radiotelegraphy Service.

You ought to petition for an RM with the FCC. Start a movement to make
the ARS all-code, no voice, no data, nothing else but on-off-keying morse.

That would make you happy, right, Reverend Jim?

>
>And that's where your argument falls flat on its face. The point is
>operational, on the air *communications *. It's called OPERATING.

The SAME is true for Citizens Band Radio Service.

OPERATING.

Take a close look at ALL of Part 97, Title 47 CFR, senior. It requires
each and every licensed radio amateur to be responsible for their
radios' technical standards. It's the LAW, senior.

>Has nada to
>do with anything beyond, although placing a radiotelegraph on the air on HF
>happens to be, as well, the most simple of stations to get up and running.

Tsk, tsk, that was wayyyyy back in time when SPARK was still lawful,
senior.

> It's the BASICS, Bill. When you can't appreciate the fact that
radiotelegraphy
>is radio at its most basic it's no wonder
>you can't understand the concept.

Sorry, senior, that's YOUR Fantasy Island thing.

Radio at its most BASIC is voice transmission. Push to talk, then listen
for the voice from the other end. No specialized morsemanship needed at
either end.

> The entire point is that radiotelegraphy using manually encoded Morse remains
>as one of the most, effective, and COST EFFECTIVE means of
>radiocommunications,
>even after all the years it has been in excistence. But only when operators
>self-train to gain the skill to use it.

"Cost effective" for WHO?

All that time spent on "self-training?" All that time spent in a government
classroom drilling in code? Taking five times longer on a radio to convey
things not covered in Q codes, compared to the slowest of other modes?

> The FCC has every reason and more than ample justification to require EVERY
>ham to be able to actually pass traffic in Morse on the air.

They do?!?!?

Haven't seen that in Part 97, senior, and it certainly isn't in the Radio
Communications Act of 1934.

You must be reading things that aren't there...or are there only in your
Fantasy Island existance. The rest of us don't live on that Island.

>It's easy to make
>a case that the ability is a valid requirement for licensing. The fact that
>they have not chosen to do so is far more related to the wants and desires of
a
>vocal few, and a whole lot of PC, than the actual operational
traffic-handling
>capacities of the ARS.

Oh? The Archaic Radiotelegraphy Service is now ALL ABOUT "traffic
handling?!?!?"

A 100 WPM electromechanical teleprinter has a throughput FIVE times
greater than a 20 WPM morseman and can sustain that as long as paper
and ink last (over a half day at continuous output). Not only that, both
ends can be operated by anyone with minimal training. Bandwidth is less
than 350 Hz, too.

Who GETS all that "traffic" that is "handled," senior?

> Now you'll come back with the same old saw about how it's "no longer sued"
for
>this or that.

Phil will have to chime in on "no longer sued." A legal thing, right? :-)

>Just as though no such need will ever again present to the ARS,
>ever, under any circumstances. Whatta crystal ball jock you are!

Well, since it is illegal for you to use SPARK, old-timer, from your words
I'll bet you are still using your CRYSTAL SET receiver, right? :-)

Tsk, tsk. A push-to-talk voice transmitter and an ordinary receiver is all
the
BASICS to effect communications by radio.

No need for "self-trained" morsemen...or even those trained by the military.

Morsemen are needed at BOTH ends of the radio circuit. Very specialized
and NOT at all "basic."

Bad logic, senior.

>
> If you don't believe that promoting and expanding the use of radiotelegraphy
>is doing same to "radio in general" there is news you've not yet heard.

What's to "promote," senior? Morse code was first used commercially
in 1844. In 159 years of existance it has been "promoted" some time
ago, back before radio began.

"Expansion" is ridiculous. Back from 1896 to sometime just after WW
One, on-off keying was the only way to use radio for communications in
general...and Morse Codes were used because of their familiarity to
old telegraphers. That indicates that such code had PEAKED in the
"expansion" long, long ago.

>> For that matter, there aren't
>> profeciency tests in other modes of operation, either, in the

>any of the others by cracking a book and doing a little hookup wiring.
>With manual radiotelegraphy, there is really no way to do it short of
>selftraining. Thus the CW test.

"Thus the CW test?!?!?"

The "CW test" was required in ALL of early radio by governments simply
because it was the ONLY means to effect communications in early radio.

It had NOTHING at all to do with "training," either "self" or formal.

NONE of the U.S. radio regulatory agencies were ever chartered as
academic or "training" organizations.

>> I also read the news and listen to it as well and hear all the time

>job efficiency to suffer. Dollars are conserved, so it is done.

TIME is conserved more than anything, senior.

Are you saying that morse CANNOT get through as good as all other modes?

That WAS your flag-waving paeon to morsemanship before. Now you've
finally realized that on-off keying just can't hack it...marvelous!

> Ham radio has no such needs nor constraints, even for emergency comms.

For some, ham radio has become a living museum of radiotelegraphy. :-)

>Maximum
>throughput is the *last* thing you need when the desperate need is for *any*
>communications.

Of course...and the human voice "cannot" be as effective as on-off keying?

>At that point what is needed is basic, reliable, ubiquitous
>communications modes.

Like push-to-talk voice transmitters, useable by anyone, hearable by
anyone with an ordinary receiver. Basic, reliable, easy to use.
Ubiquitous certainly, far more so than needing specialized training in
morse code at both ends of a communications link.

>In ham radio, Morse is second only to the voice modes,
>by far.

SECOND, senior, a distant SECOND...and then only on HF ham
bands. Note: The vast majority of EM spectrum allocated to radio
amateurs is ABOVE HF.

>I can imagine that NCI strongly favors changing that, despite their
>statements to the contrary - for obvious reasons.

No Code International has ALWAYS been about eliminating the morse
code TEST. They have NEVER been against morse code USE.

The TEST. Only the TEST.

Anyone can USE morse code without the federal TEST...and that includes
licensed Technicians in the only two ham band sections allocated to "CW"
only.

>> > WRONG story, full of total inaccuracies

> Well, you old Hoop jumper, none of that has anything whatever to do with
radio
>communications, much less ham radio nor Morse code. It's just more NCI mumbo
>jumbo drivel straight from the Carl Stevenson X files.

Tsk, tsk, tsk...all that name calling! :-)

Almost 50 1/2 years ago I was doing regular primary communications on HF
trans-Pacific without needing to use morse code or having to be trained in
same. That was true of all personnel in my signal battalion working at Army
station ADA.

Tested morse code skills are NOT NECESSARY in modern radio
communications, whether government, commercial OR amateur radio.

> If you refuse to learn how to handle radio's most basic mode you can never be
>able to regard yourself as fully qualified in ham radio communciations.

Yes he can...and also anyone else who isn't living in some fantasy
world stuck in the standards and practices of 1930s radio.

> That's just the Way it Is. Live with it.

That's the "way it is" in the Archaic Radiotelegraphy Service, senior.

Too bad that "spark" is outlawed in radio communications. You no doubt
would have required everyone in 2003 to know basics of "spark" transmitters
to be "fully qualified as ham radio operators" today. :-)

Go back to Fantasy Island, Tattoo, de blane is landing...

The only thing I don't like, is that for the prosigns, you have to make some type of chart to remember which key is responsible for each prosign, as the normal computer keyboard does not have a AR or BT (etc.) key on them last I knew. In the set-up of the program, there is other prosigns available, but probably not the ones used for an exam, but might be commonly used on the air.

I don't know the specific figures, but it seems like there are enough opportunities to put alternative means of electrical energy creation such as windmills and so on that it would provide a decent amount of supplemental energy. There is a small (maybe about 120-150 feet wide) hydroelectric dam in Sanford, MI, which is not too far from where I live, and it does not provide energy as a primary source, but supports "the grid" on a secondary source.

I am sure, with gearing, that the windmills placed in "windier" areas could also provide secondary power as well.

>The lower half of the HF bands except for 160 meters is
>"cw/fsk only"....

Incorrect! NONE of those segments are "CW-only". They're all shared with data modes.

Those data modes can be FSK, PSK, OOK or combination modes (PSK-31 is part PSK and part AM, for example). In fact, FCC allows an enormous variety of modes in those segments.

And it's not "the lower half" on bands like 17, 15, 12 and particularly 10 meters.
>

How do you figure that?

Most non-US administrations don't have the elaborate comment/proposal/NPRM structure that we have. They just do what they think is best, regardless of what their hams think. Look at Germany, for an example.
>

Drive east on Interstate 10/20 and you'll see hundreds of them overlooking the valley just east of San Bernardino. You can't miss them - they're good sized and plainly visible from the Interstate (many are right beside the Interstate, with many more placed along the hillside in both directions for several miles). It's an impressive sight (but not very attractive).

> Dwight, I worked on Solar One in Barstow, CA, the first

Do you know where the one in Arizona is? I saw it about a mile off to one side the Interstate as I was driving through. There was a sign for the road leading to it saying something about a power research facility, but I don't remember the name of it.

> Solar Two replaced it, trying out more things in re solar power
> as heat. The two plants put about 50 to 100 MWe into the grid
> (as I recall). A small part of the GWe required by the region.

Very likely. I don't think solar is going to be able to supply power on a large scale anytime soon. In the meantime, additional fossil fuel plants are the only real option. Nuclear power may one day become more viable, but people will have to be convinced of it's safety first. And steps will have to be taken to lower costs and better deal with waste products. Until then, I have serious reservations about additional nuclear power plants.

Simple...a bunch of (then) old farts were convinced that all amateurs HAD to know morse code in order to BE an amateur.

So you have now joined their ranks and are an old fart (before your time). Aren't you proud?

Let's all hear it for ALL the old farts who DEMAND that ALL amateurs test for morse code to "prove themselves" to all the other old farts in amateurism. Keep 1896 alive and well in the hearts of all amateurs.

Meanwhile, all us long-time pros will just keep on ignoring morse codes as anything "basic" or whatever since it went obsolete in radio long ago.

US amateur radio seems to be a living museum for morse code, kept there by the fierce and unrelenting self-promotional morsemen who claim to know all about radio amateurism.

Keep up the wonderful world of antiquity.

That's not strictly IN "Los Angeles," Dwight. :-)

Try Riverside County, not Los Angeles County. Big place out here.

Try Kern County to the north, on the way from the grapevine into the
southern tip of Huge San Joaquin Valley. Lots of them there if one
looks.

No. Haven't been far into Arizona since 1977.

Solar One in Barstow got decommissioned some time around 1983 and
Solar Two came up in the same place around 1985 (give or take).

From what I heard from electric power folks in the IEEE, neither of the BIG Solar power plant types could make electricity as cheaply as either fossil fuel or nuclear or hydroelectric plants.

Check out France. Over 80 percent of their electric power comes from nuclear generators. France is also the leading European reprocessor of "spent" nuclear material. Where do the French toss their unuseable nuclear material?

Electric power generation isn't exactly a big "amateur radio" policy issue, is it? :-)

All radios run on electricity. Except maybe the morse radios..."CW" gets through when nothing else will, so I would hazard a guess that "CW" radios don't need electricity at all. :-)

Keep that crystal set ready to go in case of power outages! :-)

Who is "Reverend Jim", Len? You and Brian Burke keep using that name
to address someone.

It can't be me, because I graduated from electrical engineering
school, not divinity school. And my name isn't Ignatowski ;-)

What engineering school did you graduate from, Len?

> IN the Archaic Radiotelegraphy Service...

No such thing exists.

I've been "in" the Amateur Radio Service for almost 36 years. You have
not done so for even one day.

> I built a simple battery powered voice transmitter back in 1948.

That's nice, Len. On what amateur band did you bootleg with it? Or was it a broadcast band device so you could pretend you were on "Ted Mack's Amateur Hour"? ;-)

I built a simple *AC line powered* Morse/CW transmitter back in 1967. Covered the 80 and 40 meter bands. Required a valid Amateur Radio license to operate.

>Single tube, very low power, worked fine for a whole block.

Ah - several hundred feet.

My transmitter was single tube, 10 watts, worked fine for several hundred *miles*. Despite my homemade receiver, lackluster antenna and entry-level skills. ;-) :-) ;-P

> Was 14 then. :-)
>
I was 13 then ;-) :-) ;-) --;

Perhaps that's why you want FCC to stop licensing people under the age of 14 - they might do things you did not do at that age. Oh wait, some of us have already done so.....

Not me.

Was your 1948 'transmitter' type-accepted?
>
> Why would you WANT such a thing?

I don't. Why do you think I want such a thing?

I simply asked:

"Why should there be *any* written test on theory if all a person wants to
do is operate manufactured radios? If someone doesn't want to build a

rig,
why should they have to memorize all those symbols, diagrams and
formulas?"

Nothing about "type-accepted radios" - which term isn't used any more,
anyway.

Why are you avoiding that simple question?

Dwight, we would need to change how we used energy, and in the solar
arena, conservation is key.

In the early 90's I took my older son's camping at Land Between Lakes,
KY/TN. There was an 1860's working farm as part of the scenery. The

weather was hot and sticky, we should have been out on the lake. Anyway, we were looking over the farm and I had decided when we pulled in that I wasn't going to go into the old farm house and get cooked. Anyway, as I stood on the breezeway at the back of the house, between the main house and the summer kitchen, I noticed that there wasn't heat pouring out of the house as I expected. So I went inside and things were pleasant. Upstairs and downstairs. No electricity.

My 2000 sq ft Ranch would have been sweltering under those condx.

The key was ventilation at ceiling level of the exterior walls, as if one of the logs were missing.

Go figure.

For some reason I envision truckloads of refried beans rolling into L.A., to assist the valiant cadres of illegal aliens in keeping a steady wind going.

How you Californians keep them all facing away from those hills at the same time, is what I wonder.

This paper is discussed in de.comm.ham at the moment.:

www.tinyurl.com/nkt0 and
www.tinyurl.com/lmm3

Does the RSGB do something about it, is it discussed?
Does anybody know more about it? This does not look good.

Sorry, if this has been brought up already, a pointer
to past discussions would also be appreciated.

TIA

Nor have I. But he's doing pretty well for 305 years old, dontcha
think? ;-)

> I'm not saying he's dirt dumb, just not the typical "rocket scientist" type.

It doesn't take a lot of brilliance to pass the Extra written. Just
enough right answers.

> Again, if is's an act, it's a darn good one (and that's the only good thing
> about it).

Of course. Bruce embarrasses the procodetest side, just like some
folks embarrass the nocodetest side.

In fact, that may be his entire game.

Bruce can prove Rev. Jim's postulate by acting civilized. No more
leering at Kim, no more "CB-plusser" talk, no more "if I married my
Technician sister, would I still be a CBer?" questions, no more
calling other people "morrons."

I would go with the "serious developmental problems" postulate in
Bruce's case.

> Nice concept on paper, but in the real world... Quite frankly, what
example
> has NCI given to the prospective ham? It sure doesn't exemplify the values
> of a "self-starter."

so where is it written, and what proof is there, that ONLY cw training
is exemplifies one as being "a self starter"? Would you say that means
all the other fields of studies and all the other areas of discipline are
full of "non starters" because CW isn't part of the agenda?

just the idea of getting into ham radio, studying to pass the exames
and learning to put together a station is, in and of itself, an example
of a self-starter, since on only the will and love of the hobby drove
the person to do it. They didn't HAVE to for any reason.

I like how you picked up on his condescending use of the age reference...

I remember on the local VHF frequencies once I got in an argument on the
air about (guess what???) cw testing... and the fellow I was arguing with
(oviously several years my elder) tried to belittle and detract from the
factual approach of my argument by referring to me as "young man"....
you know, "let me tell you what, YOUNG MAN, ... etc etc..."

so I had the PERFECT come back. I told him "okay, we'll end the
debate right here; you are judging the accuracy of the debate and,
thus, who wins, solely on who's older, not who's more correct. I'll
go find my friend [not included here for discreetness], who just
celebrated his 82'nd birthday; i'll let him talk on my behalf and just
feed him the lines to say, and since he's OLDER than YOU, that
means i'm automatically right, even if he, vicariously through me,
claims the moon is made out of green cheese, right?"

as I recall, not too much was said after that.

it's so easy.

> Now he feels foolish.

more or less a "bovine" mentality isn't it? the whole herd, mooing and everything,
was herded into the trailers to be taken to the slaughterfactory.... and to it they
went.

now that the times have changed and don't require it, they're mad because we're smart enough to realize we don't have to respond to the cattleprods and go up that ramp into the trailers... and off to the factory, just like THEY did....

Oh, MAN! GOOD POINT!!!!
that's what I like about forums, enough people share ideas and group X thinks of things that group Y didn't, and vica versa... just where IS the PCTA's emphasis on "basics" and such, when the very basic beginning is not only NOT pushed upon them, but outlawed?

Oh, it's TOO sweet!!!!!!

Maybe morsemen could use numerology to "prove something" new
about morse? So far, they only thing they've "proved" is that 'they did it
so everyone else has to, too.' It would be nice to see something new
about their addiction...er, affliction...no, I mean attitude of the ages.

>
>Oh, it's TOO sweet!!!!!!

Well, that's how it goes. Every amateur must know morse in order to save
the next Titanic or something. Morse is used "countless times" in national
emergencies. It is the next most basic radio communications thing, etc.
["countless" is apt because the number of actual emergency comms done
by on-off-keying modes is zero, zilch, nada...unless the self-promoters
think that Health and Welfare messages are "emergencies."]

"Spark" or damped-wave RFI generators could only be used in any kind of
communications by an on-off keying mode. Wasn't possible to AM it or
FM it, or PM it or much of anything else except on-off kind of thing.

Somewhere about now, Rev. Jim is going to come up with the famous 1906
first-known AM application...and conveniently fail to note that such was
done on a rather large alternator generator (definitely not a "spark" xmtr)
and using a water-cooled microphone. Not really practical except it proved
AM was possible and receivable on a crystal receiving set or coherer.

Beep, beep

>
>interesting topic spin-off, but I once researched where the term "ham" came
>from... the only thing I could find was that it was simply a bastardization
>of the term "amateur"

Heh heh. We will now expect that ARRL supporters to jump and reference
the "official" source of "ham." For once the ARRL is close to the truth.
:-)

Etymologically speaking, American English was already using "ham" as a
poor substitute for beef at the turn of the century before last. In show
biz
the term "ham actor" referred to a showy, not-very-good entertainer who
was more interested in presenting themselves than the stageplay.

The progression from "amateur" to "ham" was a natural for American
English speakers (a "bastardization of the word amateur" as you say).
According to the ARRL "official" source of all things amateur in the USA,
the word "ham" was used by professional radiotelegraphers as a not-nice
term for the non-professional radio amateurs way back in the beginning of
radio time.

"Real hams" do NOT like the word "amateur" at all applying to them. Some
want to be considered of "professional caliber" and constantly shoot off at
professionals in radio. They are shooting blanks of course, and their
caliber is about BB size.

So, we've got a bunch of these "professional amateurs" who want to be
"better" than real professionals because they think they are so damn
good. No doubt they are very skilled at morsemanship and have been
tossing out money for decades in building their "station," but very few are
REAL professionals in the sense that they accept money for amateur
services rendered (illegal, of course, a sort of "financial bootlegging").

ARRL is "professional amateurism" in an organized sense and with an IRS-
reported taxable income of $12 million or so a few years ago.

REAL hams are "superior" or something. They keep saying that outright if
not implying it constantly. I'm not sure what their "superiority" really is
other than marketing certain kinds of plant growth nutrient surrogates. :-)

Amateur radio remains a HOBBY, a recreational activity that requires government regulation due to the physics of radio waves. Apparently new folks aren't supposed to enjoy it or have fun in it unless they bow and scrape to their "superiors" in ham radio. Rank, title, status, privilege are
all "necessary" in the hobby of these "superiors." :-)

When questioned on their actual enjoyment of the hobby (to them it is a "service" of a higher calling), they answer that they enjoy it "more" just because they are "superior." :-)

> cursive directly without first being taught print? No.

I am trying to figure out what you are trying to make a point of,
Clint, but it's a bit trying to read through.

> However, it's simply another skill that can be taught, and they
> do, and that's fine. However, they do not look at CW the
> same way; it's pass/fail, not merely a percentage of test
> that needs to be passed.

You, Like Lennie the Lame keep trying to incriminate some group
of people called the "PCTA", accusing them of forcing this "Pass/Fail"
criteria on them.

Clint, read the >>FCC'S<< rules. THEY made them, and like thier
predecessor the FRC, gave the same weight to that test for the same
reasons.

The ARRL did not make those rules...neither did the Radio Club of
America nor any other non-governmental entity.

If you can only copy 70% of the letters, that means you cannot
copy the message being sent to you.

That's only 18 out of 26 characters. Could YOU make sense out of
a message that only utilized 70% of the known alphabet? What if the 8
characters YOU chose to not learn are not the same 8 someone elso
chose to not learn...?!?!

> Do you think they would support a system where you had
> to be tested on CW, if an only if you wanted to use CW
> on the CW part of the bands?

Clint...read the rules...CW can be used on ANY part of the
allocated bands.

Have you thought this out?

>Heh, of COURSE not.

I didn't think so...

> That is where thier anology fails. The art of CW needs
> to be tested with a practical test if you are to use and
> learn CW, but not necissarily ham radio. I would have
> supported a system like that, where if you wanted to

> be tested on if first, but of course, that was out of the
> question.

There's no analogy here to fail, Clint.

> They do not, however, likewise, first test people
> on knowing how to build a double sideband carrier
> transmission if they want to operate AM; they do
> not require you to show how to get a microphone,
> talk on it, and recieve the response on a speaker
> if you want to use frequency modulated radiotelephone,
> or single sideband carrier suppressed radiotelephone.

Once upon a time that's EXACTLY how a person became an
Amateur...It was all on paper, of course, but you either knew the
theory and circuitry or you didn't.

I would be completely in favor of a testing requirement that
mandated true knowledge of the theory required. I believe the content
of the present pool questions is entirely adequate >>IF<< the pools
were closed.

> But they DO want to force CW on people that don't
> necissarily have any interest in operating it. "basics"
> arguments fail; "selftrained skill" fails because everything
> is a selftrained skill, why put the emphasis on an outdated
> mode instead of testing selftrained skills on new, modern
> modes of communication?

Clint...Get over this attitude of "vicitmization". It's
childish.

The FCC is already at work acting on petitions to drop the code
testing requirement. In no time at all, you will be able to jump
right in there and tell all the other good buddies what your personal
is, how much swing you've got on the flat side, and which chip you
changed to get on that "channel", and you won't have to learn one
single letter of the code to do it.

> United Nations Resolution 678 quote...

Extremely restricted, but I CHOSE to live there, and that is a choice, in retrospect that I wish I hadn't made. In the long run it is actually a good thing, as I am saving monthly around 100-120 dollars towards the down payment on a house, as well as repaying some debts of which a hole that I am in that I still can't see any light at the top from where I am at, but I AM making progress, and that is the best way I can look at it. On a good note, I have almost $5,000 saved in about 3 years for this whole downpayment thing! :)

The way I was taught to think of it was that the length (overall) is the
reference to the "length" of the dipole antenna. For example, a "half-wave"
dipole antenna would be a "quarter-wave" in length on each side of the
center insulator or center point. So a full wavelength dipole antenna would
have each "side" of the dipole being one-half wavelength each.
Oh well.......

Actually, those of us at the core of NCI are "self-starters" as
we didn't sit around and wait for anything...we actively helped
"make it happen."

> > More to the point, is there any minimum code
> > speed that should be banned from the CW/data segments at the

>
> Couldn't care how slow...as long as said CW/Data sub-bands remain intact.

Last I checked, there were no such subbands as CW was allowed
everywhere except for some portion of 220MHz

... and the argument that it makes a good "yahoo" filter is wrong, due to the fact that most of the on air violations are made by very veteran hams with advanced liscences... thus, they themselves passed a code test.

If CW is the mode being used, it does. How many FCC violations by those using CW, Clint? I'll answer that for you -- the *vast* majority are made by those using the various *voice* modes. So says the FCC summary of enforcement actions. Check out the ARRL web site if you doubt it. As a matter of fact, I have never heard so much as a cuss word on CW in the ten years I have been licensed. Can you say the same about FM or SSB? I just love these specious arguments the no-code crowd makes. Now, don't even get me started about how antiquated SSB, AM, and RTTY are compared to the much more modern applications. I say stop *all* testing requirements related to SSB, AM, and RTTY now. :-))

Too bad that is the only place you probably will see it. Hams already know the capabilities and/or benefits of amateur radio.

Now, I see the "morning shows" are already showing coverage of the potential storm, and gee, wouldn't ya think a story or interview on one of those shows would have "some" impression." And of course if the average Joe (or Josephine) ham was to call up CBS, NBC, ABC, etc. and try to get some time, I am quite sure they wouldn't have much luck. BUT an organization supposingly representing amateur radio, with alleged clout would have a better chance of getting a story or interview in front of a much larger public, such as these morning shows.

I was on the upper end of the bands.... man, there was even MORE
activity.... boy, we need a practical test to see if anybody can send and
recieve ssb quickly for 10-10 contests or something.. DAMN! how has ham
radio survived without it???

Based on the stuff I hear regularly on SSB, I would certainly be in favor of
some "practical" testing. Of course, they would then have to start a NSSBT
crowd.

The fact that morse is in use o ham bands offers no reason
to have a code test in order to begin learning and using the mode.
If a new ham without code knowledge decided to get together
with another ham to mutually learn/use code at veerrrryyy slow
seed (say 1-2 wpm)...would you oppose that?

>
>Those who had to do essays and draw diagrams might disagree.

Well, it's not the fault of those who didn't that those requirements were
reduced. As stated previously, if those had been the requirements I faced,
I would have been up to the challenge. I readily accede to the fact that
those hams who faced more challenging requirements than I did are
better hams than I am for having had that experience. All I have is
the same license class.

Newp, sorry. A 40M 1/4-wave dipole can be made to resonate just fine and
work wonderfully. Its position to the ground and center angle have
everything to do with how well it will radiate. And, using a balun or not
doesn't change the whole concept of using a 1/4-wave dipole at any
frequency.

Whether you want them to or not, they work.

He's referring to the large windmill field at Indio on I-10. I've driven through there several times lately, and yes I agree- Impressive, and in no way unattractive.

"Len Over 21" wrote in part ...

Well, that's how it goes. Every amateur must know morse in order to save the next Titanic or something. Morse is used "countless times" in national emergencies. It is the next most basic radio communications thing, etc. ["countless" is apt because the number of actual emergency comms done by on-off-keying modes is zero, zilch, nada...unless the self-promoters think that Health and Welfare messages are "emergencies."]

My EM Agency has multiple sets of HF gear and every one of them is manned by an ARS operator that is CW capable -- and we'd be foolish not to include that capability in our EM package. Now, don't get me wrong, I just love the new technology. As a part of that, we have FM trunked radios, laptop computers, closed network capability, VTC Scotties, and SATLinks. IOW, we use *all* of the tools available to us. Why not just admit that CW does have a place in the EM package -- or are you just so dug into your position that you can't see the sky anymore? IMO, it's not necessary to throw out the older viable technology in order to embrace the future. If that were the case, none of us would ever use a hard-wired phone again.

The fact that morse is in use o ham bands offers no reason to have a code test in order to begin learning and using the mode. If a new ham without code knowledge decided to get together with another ham to mutually learn/use code at veerrrryyy slow seed (say 1-2 wpm)...would you oppose that?

As a matter of fact, I'm teaching a guy code now that runs about 4 wpm -- and he is *yet* to take test one. I don't need to tell you that this is considerably slower than I usually send/receive. But, the fact is that we *all* started at 0 wpm and worked up from there. My prediction is that my friend will be up to a reasonable speed in no time flat. It's all in the attitude of the learner and elmer, Bill. I have no doubt that CW will go on much longer than any testing requirements. That's why I continue to promote and teach it.

Made lots of sense. In SF we gave the tests once a week, on Friday,
and we were not equipped to handle the same folks week after week.
The five weeks between test-eligible days was adequate time to prepare
better.

>Now here is something that seems has been improved upon. If there are
>going to be different elements, it makes sense that if one element was

>General twice because I flunked element 1 the first time. I passed the
>writtens, I would have passed them again. Not muchpoint in wasting the
>VE's time.

Elements 1 and 2 were simple stuff. Now if one passed the 13 WPM
code and the General written but failed the Advanced written, one
got a General license and did not have to retake the code or the
General written test to take the Advanced written test the next month.

The Extra, OTOH, was a "package". One could take the 20 WPM code,
pass it, pass the General and the Advanced writtens, and fail the
Extra written. Then, one would get an Advanced license, but would
still have to retake the 20 WPM code and the Extra written.

>> Usually they would not tell you how well you did other than "Pass"
>> or "Fail". They did NOT tell you which ones you got wrong. (At least
>> not in Philly).

In NY, if things were quiet, "Uncle Charlie" Finkelman would let you
watch while he graded the exam, but you could not review the
grading. In SF, you handed the paper in, and if things were slow
you would get the P/F results while you packed up your gear.
Otherwise, you went home and you were notified by mail of passing or
failing if you left a SAS postcard with the examiner.

>The VE system is a huge improvemnet over tha old system, I have to say.

That's your opinion. I beg to differ, but I'm biased.

>happening in the country at the time this was happening, the FCC tester
>(government) was replaced by the VE's (non-profit, but certainly private
>sector. The changes in the tests might seem like a de-regultion type of
>move.

That was the era of privatizing the FCC's functions. I call it
what it is - avoiding the FCC's responsibilities traceable to
the ineptitude of leadership of the agency and of the country as a
whole. "Get rid of what you don't understand" is the easy way out,
not the smart way.

The amateur testing was but the tip off the iceberg. Within ten
years (1985 - 1995), the following responsibilities were "privatized",
i.e. spun off to the private sector.

Testing of amateur license applicants.

Testing of commercial operator license applicants.

Testing and certification of broadcast operators, now made
voluntary.

Testing and certification of land mobile repair and adjustment
technicians, now made voluntary.

Frequency coordination in the microwave, broadcast and land mobile
services.

Interference resolution in the microwave, broadcast and land
mobile services.

Bi-annual inspection and certification of compliance of broadcast
stations.

Inspection and certification of marine radio installations
required for safety by statute or treaty on passenger-carrying
and ocean-going cargo vessels.

Auctions and encouraging wireline and wireless competition are
deemed to be far more important than patrolling the ether.

And the beat goes on.

>I guess I'm not going to blame the liberals for this one....

They're both guilty. Stupid is as stupid does.....

>You were allowed to bring a mill for receiving and speed key for sending, but
>you'd better be well-prepared if you showed up with same.

No mill was allowed for amateur tests - all copy was by hand. A
mill was allowed only for the First RadioTelegraph (Commercial) 25
WPM plain language test - not even for the 20 WPM code group test.

Speed keys or later on electronic keyers were allowed only if they
could be hooked up to the straight key terminals (with about 67 V
"B+" on them). Only once in all the years did I see anyone with a
bug who used that special "spring" for connection to the body of a
J-38 type straight key.

I sadly do not expect the FCC to get back into the exam business,
but there is nothing stopping them for requiring the VEC/VEs to run
the tests like they used to be run.

All it takes is commitment.

That was the deal that the League worked out with the FCC - if the
radio did not transmit "out of band" then the preemption covered.
The intent was to exclude VHF/UHF transceivers which have been
"opened up".

I'll dig out the Public Notice if I can find it. It was many years
ago.

>If I add 5 MHz capability to a radio do I now lose all protection of
>Federal laws?

Does your HF transceivertransmit on public safety VHF/UHF
frequencies? Does your VHF/UHF amateur transceiver transmit on 5
MHz ??

>What about if I build a kit or use a land mobile radio in the ham bands?

If you have the installed capability of transmitting on a non-amateur
frequency and do not have a license for such operation, it is not
covered under the preemption and it's your job to talk yourself out of
the jam. You're on your own.....

According to the same 1930 ARRL Handbook, "The Wouff-Hong is amateur radio's most sacred symbol and stands for the enforcement of law and order in amateur operation." The Wouff-Hong's nearest analog is the old-fashion but still effective can opener. Now every can opener requires an initial insertion point, and (if you picture the human anatomical form) you can choose between upper and lower points. The object is to open up the miscreant and expose his evil to himself. This requires the subject to be supine and all opening to be done on the front side, where the victim can indeed see the results: the exposure of his own evil. The beauty of the wood Wouff-Hong lies in the fact that it leaves splinters in places from which they cannot be removed. Thus is the scoundrel reminded for life of his misdeeds and what lies ahead if any one of them should ever be repeated.

Well, DICK, make that dick, matching is the name of the game with nearly any
"wire" type antenna, so you must be too dumbed down to pick up on that
concept. It doesn't matter the matching, it was said first there was no

such thing as a 1/4 wave antenna. Then, when proof positive was given, the *cough* superior hams (such as you in your mind) said "it would never work." Then, when proof positive was given, all that's being done now is sneering.

So, superior ham(s) et al, try again....

>
> In the real world what?

In the real world, many of AR's newbies won't even bother to try CW because
it takes too much effort to attain a usable level of proficiency. Studying
for and passing the 5-wpm test gives one a very basic level of knowledge
(NOT proficiency) and enables him/her to make an *educated* decision as to
whether or not s/he wants to pursue CE any further.

> Bill K2UNK

I did write CW/Data, right? HOWEVER, I don't expect to encounter many NCTA's
on the bottom of 40 or anyplace on 30.

Just watch the unequal ground between the two when a seasoned CW op outpaces his phone op counterpart in a sprint for certain rare DX contacts. Heck, I've read that some of them only work CW. Liken it to the race between the tortoise and the hare, but the tortoise KNOWS how to read the road signs and the hare is confused because "there's no pictures." Think it's a bad analogy, Bill? Try looking at the cash register keypad next time you go to McDonalds...the result of the very same mentality of underachievement NCI "actively made happen."

Cheers to you, Bill.

Every culture has it's dark spots, this is amateur radios. Some think it's
fun to joke about. It's pretty sickening, if you ask me. Anyone who has
truly studied what man is capable of doing to man during the Medieval period
or The Spanish Inquisition know this.

I think his description of the Rite of the Woulf Hong is a bit stretched, in
fact quite a bit.
My take on it was that it was a tool from which only a gentle prod in a certain
part of the anatomy was all that would be needed to correct the miscreant.
Maybe the thought of things to come if he didn't straighten up and fly right
was the main impetus.

Yea but, hes forgetting to add the Gain of his Ant and the Gain of the Repeater Antenna into his figure. And then of course you have to consider ERP so his figures are probably pretty low.

I had one ham insist that with antennas "gain is gain", when I tried to tell
him
that what you add in one direction you must take from another. He still doesn't
beleive it.

Do you really think the FCC has or will have a change of opinion...
especially in light of the entire international community endorsing
the end of mandatory code testing as an ITU requirement?

Has anyone come up with that WOW argument that will justify
the need for morse testing? So far, nothing new has been
offered by PCTAs at all.

Cheers,
Bill K2UNK

So what? Use of CW has never been any requirement. Those that
want to will, those that don't won't. The sorry comentary of PCTAs seems
to be (INHO) that rather than becoming advocates to promote new
hams learning and using CW, they sit here and whine that their
previously mandated recruiting process (the test) won't be there
to automatically gain a percentage of new hams into the CW
users group.

> Studying
> for and passing the 5-wpm test gives one a very basic level of knowledge
> (NOT proficiency) and enables him/her to make an *educated* decision as to

So become an advocate of that to other new hams. You can
give the test yourself. The FCC (i.e. the government) has no
purpose to be an advocate for your favorite mode.

> > > Quite frankly, what example

Eliminating archaic requirements is always something that should
be done. You must have been upset too when states eliminated mandatory
testing on manual gearbox autos and allowed testing to be done
using any car.

> analogy, Bill? Try looking at the cash register keypad next time you go to
> McDonalds...the result of the very same mentality of underachievement NCI
> "actively made happen."

Would you rather have barcode reading cash registers or the old fashioned
key punch. Today when I "cash out" I get a well detailed register receipt
rather than a simple list of individual prices with a total. If in the
process the ability to "keypunch" becomes a lost art, who cares?
Where I do see a lack of skills (specifically math) at the register is
in the ability of a cashier to understand why I am giving her/him $11.18
(a ten spot, a single, a dime, a nickle and three cents)
when my bill is $5.93. I do so to get rid of some change in my pocket
and to avoid getting a greater amount of small change and bills back.

I much prefer getting $5.25 (a $5 bill and a quarter) rather than $3.07 (three
singles, a nickle and two cents) if I only give the cashier only the $10 bill.

But this lack of math skills is not a morse skill related knowledge that has such a wide application in life.

Cheers,
Bill K2UNK

I agree, but Dick C doesn't want veerryy slow code users on HF
according to another post of his early this morning.

Frankly, I also don't understand why ARRL CW sessions from W1AW
don't start on the slow code segment with something about 3 or
4 wpm. It might offer a better entrance process for potential
new CW users to get over the air reception.

Cheers,
Bill K2UNK

I read that when it was initially out and have no recollection
of the "out-of-band" transmit aspect. The issue always was
focused on amteur rigs that could also recieve (i.e. listen to)
police broadcasts from an automobile.

> >If I add 5 MHz capability to a radio do I now lose all protection of

>
> Does your HF transceivertransmit on public safety VHF/UHF
> frequencies? Does your VHF/UHF amateur transceiver transmit on 5
> MHz ??

Today there are several HF/VHF rigs that can do so. IC-706
has 6m and 2m, several other HF rigs now cover HF plus 6, 2 and 440.
In all the cases of harrased hams (harassed by police) in states with
laws forbidding listening to police transmissions, the issue was
always listening to..not transmitting on, police frequencies.
Here in NJ we finally changed the old state law around 1994.

> >What about if I build a kit or use a land mobile radio in the ham bands?

> the jam. You're on your own.....

I truly don't recall that to be the case at all...for kits and or
commercial ham transcievers modified to allow non-ham
frequencies (e.g. MARS) or modified to do so because
there is a NEW ham set of frequencies (e.g. 5MHz)
.

> was the main impetus.
>
This is an old thread, and I already basically said as much. It's
"too unspeakable" to mention how the Wouff Hong is used because the
threat is better than the application. There is no application, it's
just smoke and mirrors.

But that people are now describing quite graphically how they think the Wouff Hong is supposed to be used may be a reflection of how things have changed. In the twenties when it was originally cooked up, the idea was to prod hams into being more careful about how they operated. The chastisement was in The Old Man talking about the lids, not in the threat of doing damage to the lids. Suggesting, but never stating, that the Wouff Hong was used in a terrible fashion was more for the sake of fun, to not take a serious issue too seriously. The whole thing was basically Hiram Percy Maxim saying "I'm disappointed in some of the operating taking place today".

That sort of thing has less power today, sadly. I'm not sure if it's the make up of the hobby, or the make up of society.

So now the Wouff Hong is being portrayed as a weapon, by itself, rather than as some pseudo-ritual connected with trying to get hams to be better operators. The true meaning of the Wouff Hong is gone, when likely it is needed more than ever. Not because there is bad operating, but because it was part of a history and community that when lost, may lead to hams not being so concerned with good operating.

I'm often suspicious of the motives of some individuals posting here. However, if one dwells on those thoughts too long, it could drive a one insane. Therefore, unless it is something obvious, I tend to simply take things as they appear, without too much worry about the true intent behind what appears. Besides, that philosophy just makes life (and this newsgroup) a lot easier.

Good grief, Kim. Are you trying to make my life harder than it needs to be? I'm having a hard enough time trying to read some of the poorly written messages here without you intentionally misspelling just about an entire paragraph. The sad part is that I'm so used to reading misspelled words, the paragraph above was just not that difficult to figure out. At this rate, if I keep reading these newsgroups, I'm going to have several spellings of words filed away in my head from now on. Eventually, I'll have a hard time trying to remember the actual correct spelling. When that happens, my own writting may become as poor as some of the others I see here. I think I need to read a good book (just to reset my mind).

This is a strange one to argue about. And I make no claims of superiority.

That there can be a 1/n antenna that consists of 2 equal sections is not the argument, or at least it shouldn't be.

This type of antenna can be any fraction, even 25/32's (the fraction of a quart in a Fosters lager "oil can") How they will perform is another matter.

On a ARS test, the likelyhood of the question "design a 1/4 wave dipole would no more likely come up than my 25/32 wave dipole. they will want you to design an antenna that has a particular impedence at the desired frequency. What is the impedence of a 1/4 wave dipole?

My antenna is 96 feet total length, cut as a general purpose dipole. I use a tuner and ladder line to match impedence with my transmitter. But I would never name it a 1/n dipole.

Perhaps I was a little loose with the specifics, Len. However, for all practical purposes, I consider just about the entire valley to be Los Angeles. The cities and towns spread out side by side from Los Angeles, with only a roadside sign to separate the individual cities or towns. From where I'm sitting, the whole thing looks like one giant metropolis. And the wind turbines I described probably supply supplimental power to that whole metropolis. However, you are correct. The wind turbines are in Riverside Country, probably supplying power to the area grid.

> No. Haven't been far into Arizona since 1977.

Well, it doesn't really matter. I was just wondering because it's the only solar facility I've personally seen.

> Electric power generation isn't exactly a big "amateur radio"
> policy issue, is it? :-)

You know how this newsgroup is, Len. If a topic gets introduced here, it becomes an issue here.

> Keep that crystal set ready to go in case of power outages! :-)

Looks like Hurricane Isabel is going to miss this area and hit north of us. Therefore, ham radio should be relatively calm, but it may be a busy weekend for the Coast Guard. However, things have been fairly quiet so far.

It could be done. I recently visited a friend living in large (40')
double-wide camping trailer. I was amazed at how little electricity he
actually used, while still having most of the modern appliances and
technologies (TV, VCR, stereo, computer, etc.). I don't know exactly how he
did it. However, I noticed that he had purchased or converted most
everything to 12v, so perhaps that is the key. Almost everything was running
off batteries, with just a small transformer charging the batteries. Only a
few things (AC) ran off the main power feed.

Anyway, while it could be done, trying to convince people to do it is
another matter.

Look at it this way Bruce. It will rid the CW segements of useless trash. They will all be on SSB. Digital will also be safe because that requires some intelligence to set up and operate a program. Thus elliminating most to all of the dumbed down hamsters.

Of course it will be a proccess of attrition in the CW field. Eventually there will be no one left.

I worry about that as much as I care about 'global warming'. I won't be here that long.

Oh BTW with the bands so sorry (SFI 97) I notice there is basically NILL action on SSB. But I hear lots of CW stuff....wonder why that is?

To at least be reasonably sure that the applicant knows where he can put
what kind of a signal.

It is also handy in a enforcement situation. When some fool runs 10kw on
top of a broadcast station the FCC has grounds to nail his butt.

See how simple that is?

Go ahead and be a smart ass. Now here is my shot. Your comment that
eight dits is a 'prosign' is in error. A prosign is SK, K, B, N, etc.
The eight dits to indicate an error is actually a operating signal, for lack
of a better term.

Dan/W4NTI

No need to worry about it - the valley is shaped to funnel most of the wind generated in a that direction. Which, by the way, just happens to be generally towards Texas (and you thought the smell was coming from cows in El Paso). :)

Just guessing....I make the impedeance at center of such a 'antenna' at
several thousand ohms.

Help me out here. What sort of a 'balun' or what sort of 'coax' will match
such a device to a 50 to 75 ohm unbalanced output of a usual ARS
transmitter?

Since the Texas TWIT has me blocked, I am addressing this to you Bruce.

> Whether you want them to or not, they work.

A couple points here Kim.

According to the ARRL handbook 2003 edition, chapte 20 page 4:

A fundamental form of antenna is a wire whose length is half the
transmitting wavelength. It is the unit from which many more complex
forms of antennas are constructed and is known as a dipole antenna.

It goes on from there if you want more.

Next I modeled two antennas in EZNEC.

One is a half wave dipole for the middle of the 40 meter band at 7.150
mHz. Each leg of the antenna is approximately 1/4 wavelength long at
65.45 feet. This antenna models out at an SWR of a little over 1.5:1 at
the center frequency, and 2:1 at 7.3 mHz and a touch over 2 mHz at 7 mHz
with the antenna at 50 feet, the take off angle is 35 degrees. All in
all, not too bad an antenna. Most modern rigs will handle the antenna
without a tuner, or simply with their internal tuner.

Next, I modeled a quarter wave dipole for the same frequency and all
other paramaters. With the legs at 32.7 feet, the antenna now displays
somewhat near infinite SWR. The take off angle has now risen to 54 degrees.

That antenna is simply not going to work well at all.

I wasn't trying to be a smart ass, Dan. I was just "lightening up" what I
perceived to be an overly terse response. Remember, I'm just asking about
something I heard (...and subsequently used) OTA.

As for the prosign issue, I never made that statement and thank you for showing me the difference.

Well, I wouldn't condider it a lock. The FCC was recently spanked by both the Supremes and the Senate. They may be reluctant to send anything new along for a while.

In addition, the US has shown a reluctance to go along with what the rest of the world is thinking.

Finally, we haven't ratified all that many treaties lately have we?

So while it might happen, I'm not going to do any betting on it.

I find it ironic that you load heaps of criticism on anyone who
dares to discuss anything other than Amateur Radio policy when YOU
deem it OK to do so...Yet this was 4/5ths of the way through a post in
which not one word of Amateur Radio policy was discussed.

More "professional engineer" "Do As I Say, Not Do As I Do"
rhetoric.

Sheesh...No wonder so much of our technology development and
manufacturing is off shore. No doubt our next new Space Shuttle will
have a Mitsubishi logo on the side, stuffd full of Avionics from Sony
et al.

Wow! That's quite a policy statement from a country with a little more
than 120 radio amateurs and it comes hot on the heels of the big move by
Ireland with its slightly more than 1,500 hams.

It's because people convince themselves the bands are dead and don't
transmit. If nobody transmits, then there's no-one to work. Granted the
bands are poor, but the WAE contest, for example, showed it up as a self-
fulfilling prophecy.

Oh, personally I agree that there should be a written test, and there
shoud be a Morse code test.

What gets me worked up is those who think that removing the Morse code
part of the testing is not a reduction in the amount of knowedge needed
for the license. Maybe its newspeak. Less is more!

All the learning is ultimately what determines the state of amateur
radio. While not an indicator of the individual ham, in the aggregate a

better educated ARS is a good thing in my book.

Not really.

At 5 wpm, each character gets approximately 2.4 seconds. At 4 wpm, each character gets approximately 3 seconds.

Not "sour" at all.

But 8 countries (so far) is hardly "world wide".

--

It will be really interesting to see what happens to ham radio in countries
where code testing is totally eliminated.

Will there be big increases in growth (i.e., lots of new hams)?

Will there be lots of new technology brought to the ARS by new hams for whom
the code test was a "barrier"?

Time will tell.

> exactly why people distrust what they are told about NP.

It's exactly for these reasons that I keep saying that we have to do the research and not let our emotions and fears sway us. And we do have to make sure we don't do stupid things. Letting kids play on piles of tailings is stupid. Even on non-radioactive piles, they can get hurt as the piles are unstable and slide.

Right now, the fear and emotions are preventing us from doing the necessary data gathering and research. Whether or not a person believes in nuclear power, this data is sorely needed. If it's safe, we need to move forward. If it's too dangerous, we need to follow other routes. That judgment should be made on facts not feelings as people are doing today.

As far as cigarettes go, the term "coffin nails" goes a long way back. The fact that people chose to hide their heads in the sand and not do the research until relatively recently just goes to show the idiocy of not doing the research.

Statistical correlations though must be treated carefully. It doesn't necessarily prove a cause and effect relationship. It can be the case that two (or more) independent items stem from the same cause. Once again, adequate research is needed to determine why two items correlate. For this reason, statistical trends should be used to trigger research not to draw conclusions.

Also there is some evidence that once one has reached the 13wpm level, they will not forget it even if they don't use. They might grow rusty and become slow. But it stays in the brain, ready to be called upon. See the book "The Art and Skill of Radiotelegraphy," which is available for free downloading from the internet. The author deliberately chose to make this available to the public for free so that there is no copyright infringement involved.

I just did a quick recount, and 9V is the 9th country, not the 8th. They are Switzerland, the UK, Belgium, Germany, Austria, the Netherlands, Norway, Ireland and Singapore.

The funny thing is the only no-coder I have yet heard on HF was PE1RMZ. I know that this is a Dutch no-code call from the time I worked PE1DUP through a UK repeater. It takes time to get on HF I suppose. I was surprised that no-one appeared to have been ready in advance.

You can try to pretend that 9V and EI don't matter, but look at the bigger picture. You know where this will all end, and a d*mn good thing it is too. If it wasn't for the bl**dy code test I would have been licenced and on HF at 14.

I've lived in Seattle. Too little sun and almost no wind. According to a book I was reading when I wanted to build a greenhouse, windloading is not a consideration there as it has the lowest winds in the country.

As far as prices, there's not enough demand to allow efficient manufacturing methods. Selling at a loss is too risky for a business unless they have a very strong reason to believe the demand will pick up.

You yourself have just stated FSK thus proving that they are not CW only.
Please note that there are portions of the 6m and 2m bands that are indeed
CW only as not even FSK is allowed there. So the statement that there are
no portions of MF/HF limited to cw only is indeed a true statement.

I have no objection to reducing the technical level of questions if the
privileges are reduced correspondingly. But we both that's not in the
cards.

Sooner or later though, they pay the price. Either they need to build power generators or buy it at very high prices from outside California from companies who have made the investments.

Whether it is regulatory, environmental, or economic, California has created its own energy mess by its own actions.

Then when the retired head of the Amateur and Citizen's Division of the FCC states in his comments to the NCVAEC petition, the writing of which he was a party, that it simply is an oxymoron that an Extra Class ham should be allowed to *not* be proficient in Morse when he is considered an expert at ham radio, you might take that as some sort of a clue to thinking in high places...

>

hm, I see.... um, and you know the one and only
acceptable definition of "world wide" huh? I guess
i've missed where it's written that "world wide"
is composed of no less than 9 countries.

The fact is, it would only take two seperate nations
to call something "multinational" or "international".. so,
would it comfort you a little more if I were to have said
"internationally, code testing is being dropped"?

you'd also do well to make a case study of how many hams
are represented by the nations that are dropping it. Many
nations that aren't are composed of nations with fewer than
a dozen hams.... and a few that are run by dicators
(lybia) have 1 and only 1 ham operator.... guess who.....

For BT, most software is set up to use the "=" sign as the code for BT is the same as the code for "=". Context lets you determine the actual meaning. In copying morse (such as in testing), the "=" sign would be correct for representing BT.

WHAT???? how can this BE?????

If they're extra class, then they passed a CW test.... from what i've
read from the PCTA, it's just not possible
to be a rule-violater if you're passed a CW test. THEY tell me that
the rule violaters will only be non-code-tested hams....

geeze, now i'm so confused.

>Do you really think the FCC has or will have a change of opinion...

Maybe - maybe not. Right now there are several petitions under consideration, and almost certainly more on the way. Lots of comments, etc., to be considered. Everyone can have their say and then FCC will do whatever FCC wants, based on whatever FCC thinks is the best thing to do.

And no matter what FCC does, some folks will think it's the wrong thing. But at least we can have our say.

>especially in light of the entire international community endorsing
>the end of mandatory code testing as an ITU requirement?

"entire international community"? I think not! Just those few who get to decide policy.

For example, a poll of German hams found them overwhelmingly in favor of keeping code tests. Didn't matter.

Heck even if you are not a seasoned CW op, it's often faster to snag that CW
DX contact. I'm far from a seasoned op since I don't get on the air as
often as I'd like but I've personally found that it takes less tries on CW
than voice even if both have massive pileups.

In fact, a lot of his "facts" are indeed of that very description!

actually, only the executive (presidential) branch has shown real resistance
to world pressures. MANY other levels of government, including special
interest groups, work to have the country damn near lay down and let
the world use us as a doormat.... such as Earth First! pushing to have
tighter environmental restrictions placed on american industry, as per
the request of the united nations which WE fund about a FOURTH of
it's treasury.

> > Finally, we haven't ratified all that many treaties lately have we?

this wouldn't exactly be a "treaty"... all the nations that are chosing to
drop CW testing haven't done so in a huge gathering with a document
with signatures on it, all in agreement.... they are doing it individually
on a case-by-case basis.

> >
> > So while it might happen, I'm not going to do any betting on it.
>

that's what a lot of people said to the proposition that higher speed CW
testing being dropped... but it did. It's gone, and will not ever return, to
the
chagrin of many.

the definition of oxymoron is a statement or word that contridicts itself.
it is only
an OPINION but not a FACT that an extra class ham includes within itself the
requirement to be proficient in morse code.

the law is what counts, and currently the only proficiency required is 5wpm
(for any
class for that matter)... and soon, that will be dropped. Then, by law, just
not
to YOUR liking, will be that an extra class ham will not have to show
profeciency
in archaic, outdated communication modes.

Packet never was very much viable on HF due to lack of noise immunity.
. The "store and forward" folks ruined it on VHF many years ago, tho when I
finally abandoned it in disgust I never did go back to check, so I don't know
what's there now.

Clint yoiu'e been reading way too much NCI propaganda for far too long.
So long in fact that YOU have fell flat on your face, or maybe the other
end.
I am capable of passing any sort of radio traffic by way of
radiotelgraphy, which I learned as a requirement of my licensure as a
ham radio operator. There is no reason for you to be exempted from the
same.

...and, just as in CW... if people get on a cw band without learning cw, they
will have a hard time navigating around and knowing what's going on. Those who don't want to, though, won't have any problem.... just as only those who tried to use a manual transmission but were only tested for an automatic had problems. Stick with what you learned.

There was no reason to force anybody to learn how to drive a standard if they were going to drive an automatic.

Again I repeat; i'd have no problem with requiring a cw test if you wanted to
use cw on the cw portion of the band. But, that's out of the question, isn't it?
we're going to stay in the past and not keep up with progress and force even people who will forever plan to use automatic transmissions to learn how to run a standard.

Nope, it's a fact. Whether or not the code requirement is kept may be an
opinion. But skills and knowledge are facts, not opinions.

>
> the law is what counts, and currently the only proficiency required is 5wpm

And may I say, *that* is YOUR opinion.

> Then, by law, just
> not
> to YOUR liking, will be that an extra class ham will not have to show
> profeciency
> in archaic, outdated communication modes.

Well you can keep a close watch on developments and keep your fingers
crossed... but whether or not the code test requirement is dropped, it's still
your opinion. Nothing more.
My "l;iking" has nothing to do with it, Clint, just as yours similarly does
not.. If a ham doesn't know Morse code, and can't operat it on the air, there's
no simply way he can be considered a fully qualified ham, and certainly not an
expert. The Extra class is named as the Expert clase of radio amateur.
So that's just how it is. Has nothing whatever to do with either your or my
opinion.

I'll take your word for it, Phil. Were mills permitted if a person was
disabled? Perhaps that's the source of the stories I heard.

The term is "wedge".

Most of us just used the straight key.

And some rules changes.

Didja know that the FISTS petition to the FCC calls for an end to "instant" retests? It proposes that if an element is failed, the person cannot be retested on that element until the next day.

(Apologies to Kurt Vonnegut)

To all external appearances, Farnsworth Corners, U.S.A., is bright, cheerful, and happy. However, in dark corners of the city lurk Godless Nocoders who seek to undermine the moral fabric of our mighty Nation.

In a dirty basement apartment, an underfed, seedy-looking old man wearing small, round spectacles and threadbare clothes, types furiously at a musty desk illumined only by a single, naked bulb. As the pages fly through his typewriter, an evil plan gradually emerges: a treacherous treatise which threatens the well-being of the upright citizens of Farnsworth Corners. The work is completed, and the old man leans back thoughtfully and smiles as he rubs the three-day stubble on his chin. The time has come for the Hammer of Maia to strike!

Some weeks later, in another part of town, little Billy Beeper walks home from school. Suddenly he hears a voice right next to his ear.

"Psst! Hey, kid! Would you like to try my 2M HT? It's free!"

Billy's eyes open wide as he faces the stranger. An embroidered patch on the mans soiled jumpsuit reads "Codefree Charlie". "Gosh, no! Nancy told me never to touch a radio which didn't beep!"

"Aw, c'mon!" says the old man. "I only wanna be friends with you!"

"Well, I don't know," replies Billy. "I was told that FM was bad for you!"

"That's just what the grown-ups say to scare you!" says the drooling man.

"The truth is that they don't want you to try it 'cause it'll make you grow up faster and be able to smoke cigarettes and drink liquor just like them!"

Billy is hesitant, but suddenly a tall form looms before them and grabs the ruffian by the collar.

"Golly!" exclaims Billy. "It's Captain Code!"

Yes, Readers, it's Captain Code: faster than a Vibroplex Blue Racer, more powerful than an Alpha three-holer, able to leap tall pileups in a single bound.

"You should be ashamed of yourself, old man," says Captain Code to the hoodlum. "There are far better ways to earn money than to hoodwink innocent children into a life of codelessness. It's to the FCC for you!

"And as for you, young friend, take my advice and stay away from strangers, and believe nothing that they say. It's tragic, but until Godless Nocodism is abolished from the world, there will always be those who would like nothing better than to hurt you ."

"Gee, thanks, Captain Code!" says Billy. "I promise that I'll always listen to Mom and Dad, and I'll keep away from strangers with shacks on their belt!"

Depends on which "back when". My 5, 13 and 20 wpm code tests were all
administered by FCC Examiners. And I took all of 'em one-on-one with
the Examiners, never as a member of a group taking the same test.

> You were allowed to bring a mill for receiving and speed key for sending, but
> you'd better be well-prepared if you showed up with same.

?? I don't recall using a typewriter being an option. Would have been
a lousy idea. I did use a bug to send 20 wpm. For maybe three seconds
before the Examiner waved it off. I shouldn't have bothered lugging
the bug to the exam.

> You had to get a certain number of questions right (74%, as I recall) on the

Conversly I have yet to pay a dime for anything the FCC has ever done
WRT to any of my ham licenses. Not for any of the three tests and not
for the 1x2. "Life is all in the timing . . ".

> So I went home and taught myself to block print. (Printing was not a parochial
> school subject - only "publics" were allowed to print. Something about being
> bold, brazen articles was involved). Next try, later that summer, I had no
> problem.

Heh. Conversly again when I got yanked outta Quaker elemenatary school
and dumped into the public schools right off I landed in "remedial

penmanship" 'cause I had no idea how to write longhand, everything I wrote was in block style. The code tests were no sweat, all block caps but I flunked remedial penmanship and they finally gave up on me. I'd still flunk a course longhand writing. So would every other half-decent drawing board jockey I've known.

> - Mike KB3EIA -
>

You can name it (or not) anything you like. I have an Alpha-Delta DXCC and
it can be used as a 1/4 (or "shortened as they say) wave dipole on 80M. It
works great and was the antenna I used at this time of year when MARS freqs
are beginning to get real noisy. Go to a longwire, go to the sloper, go to

the A-99 and the noise floor was just enough to make everyone noncopyable.

Go to the AD and everything cleared up. No one ever had a bad thing to say about signal, so I go by the non-reports.

The point, in this debate--once again--is that there are people saying there's no such thing, it'd never work, etc., etc. There are people here saying not only that there is such a thing but that there are websites with technical discussions on the 1/4 wave dipole (for all kinds of bands) and there are people here using them and telling the results. But, the ones who are using them and have results with them, and who have provided the websites with technical discussions are getting told--once again--that they are dumbed down.

Sayin' it don't make it so. And, since that is the mentality that often develops with any kind of attempt at anything remotely "real" ham radio, then that is why we "dumbed down" hams don't even regard this newsgroup as a place to try such conversation.

For what its worth...here's the IARU policy direction:

NEWS RELEASE
International Amateur Radio Union
P.O. Box 310905
Newington, CT 06131-0905 USA
FAX: +1 860 594 0259
E-Mail: iaru@iaru.org
12 September 2003

For immediate release

IARU Council Addresses Strategic Issues
The Administrative Council of the International Amateur Radio Union (IARU) held
its annual meeting on 6-8 September 2003 in Amsterdam. The meeting was to be held in Taipei in conjunction with the IARU Region 3 Conference but was moved to
Amsterdam when the Region 3 Conference had to be postponed to next year as a result of travel restrictions arising from concerns about SARS. The Council took
the following actions:

1. Four hours of the meeting were devoted to a strategic planning session with a
planning horizon of the year 2010. Several key issues that are likely to influence the future of the IARU were identified. A report is to be drafted and
circulated for further consideration by the Council early in 2004.

2. The results of the 2003 World Radiocommunication Conference concerning the
amateur and amateur-satellite services were reviewed in detail. The Council

congratulated and thanked all individuals and organizations who contributed to
the satisfactory outcome. IARU member-societies were urged to bring to the
attention of their administrations the desirability of adopting specific changes
in their domestic regulations for the amateur and amateur-satellite services, so
that they will be consistent with the revised Article 25 of the international
Radio Regulations.

3. The Council revised an existing Resolution concerning the Morse code in the
light of the WRC-03 decision to leave to each administration the question of
whether or not to require a demonstration of Morse skill to operate below 30
MHz. Under the revised Resolution, IARU policy is to support the removal of
Morse code testing requirements.

(SNIP)

Attending the Amsterdam meeting were IARU President Larry Price, W4RA; Vice
President David Wardlaw, VK3ADW; Secretary David Sumner, K1ZZ; regional
representatives Ole Garpestad, LA2RR, Don Beattie, G3BJ, Hans Blondeel
Timmerman, PB2T, Pedro Seidemann, YV5BPG, Rod Stafford, W6ROD, Tim Ellam,
VE6SH,
Fred Johnson, ZL2AMJ, K. C. Selvadurai, 9V1UV, and Yoshiji Sekido, JJ1OEY;
and
recording secretary Paul Rinaldo, W4RI.

Additionally:

IARU Says "Remove Code", Excerpted from ARRL Letter

"The focus was on the future when the International Amateur Radio Union Administrative Council met September 6-7 in Amsterdam, the Netherlands.

In the aftermath of WRC-03, the council urged IARU member-societies to call to the attention of their administrations "the desirability of adopting specific changes in their domestic regulations for the amateur and amateur-satellite services, so that they will be consistent with the revised Article 25 of the international Radio Regulations." In that vein, the IARU governing body called for the removal of Morse code as an examination requirement to operate on HF.
The council reiterated its stance first taken in 2001 that Morse code proficiency "as a qualifying criterion for an HF amateur license is no longer relevant to the healthy future of amateur Radio."

"IARU policy is to support the removal of Morse code testing as a requirement for an amateur license to operate on frequencies below 30 MHz," the IARU Administrative Council resolved. At the same time, the council's resolution recognized Morse code as "an effective and efficient mode of communication used by many thousands of radio amateurs." It also took into account ITU-Radiocommunication Sector (ITU-R) Recommendation M.1544, which sets down the minimum qualifications of radio amateurs.

> rest of the world is thinking.

The US already endorsed ending mandatory morse when we voted to
do so at the WRC confernece. Seems pretty self evident
to me.

> Finally, we haven't ratified all that many treaties lately have we?

We don't have to ratify the treaty at all. The OLD treaty is
dead and buried...there is, as of 7/5/03, no ITU mandated
morse requirement even if the USA never ratifies the new
treaty.

> So while it might happen, I'm not going to do any betting on it.

It will happen, the only thing at issue is the timing.

Cheers,
Bill K2UNK

That argument/claim found no favor in the past. The reality is that
neither the FCC nor almost every emergency preparedness
organization/operation has no desire or need for morse in
their plans. Individual hams may make the claim, but they
aren't executing the claim in the vast universe of RACES, ARES
and other amateur emergency operations.

So read it Bill-- that means they support *an* amateur radio license allowing HF operation without code, NOT the removal of all code testing.

It would still be an interesting sight to see. A bunch of disgruntled League members showing up at the next Board meeting with a bunch of wouff hongs in hand. Maybe they would finally understand they needed to listen to the members that elected them. To late to change things now though. Ham radio is on the down hill side and picking up speed. And that's a BIG ten-four good buddy breaker breaker. Got ur ears on?

KB7ADL on the side.

>modes of communication?

Clint:

Last time I looked, Amateur Radio was a strictly VOLUNTARY
activity. Nobody has ever been "forced" to do anything related to
the hobby/service known as Amateur Radio. If you want to have
privileges within the ARS, you meet the licensing requirements --
as a voluntary act. Only NCTA whiners who are too lazy and
indifferent to the true nature of the ARS to be bothered to learn
a useful communications skill like Morse/CW drag out the "I'm
being forced to learn Morse code" or "I'm having Morse code
shoved down my throat" arguments. This is truly pathetic.

The truth is that a lot of hams, myself included, never imagined
themselves becoming CW operators until they made the effort to
meet the licensing requirement to pass Morse code tests at
various speed levels for increased operator privileges. This is
the genius of the Morse code testing requirement -- it brings out
the best in interested, motivated, and incentive-driven people,
who, for the most part, become the best hams.

Clint:

In exactly what way is transmitting 6 megapixel color images using
CW "applicable in the real world?" I'm an avid CW operator, but I've
never heard of any way to do that using Morse code. However, since
you seem to think you're some sort of technical genius, I guess
you've got it figured out!

BTW -- if I'm "trapped in 1952" -- the year I was born, BTW, why isn't
a gallon of gasoline selling for 24 cents? Damn those time traps --
they're never around when you need them!

I agree with TIT, all No-Codes should start using 1/4 Wave dipoles ASAP. I think that should put a halt to worrying about the No-Coders getting on HF. Tell you what, this one time, and one time only, I will be a nice guy to No-Coders, and provide the length of a 1/4 Wave dipole for any Freq they choose, as long as they promise to use it .

I'm living proof of validity of the "use it or lose it" theory. I
spent a couple decades+ running CW >13 wpm then I put ham radio aside
for the following couple decades. When I decided to jump back in I was
absolutely convinced that I'd have to relearn CW, or at least I'd have
to work at regaining the speed I had when I dropped out. Was *not* the
case. I could still copy 30 wpm in my head like I'd never left the
bands. Amazed me. But I guess once the neurons are firmly welded
together they don't come apart for life. I think I lost some of my
ability to get it down solid on paper at speed and I'm working on
that.

However I do not agree with a hypothesis that simply cramming for then
passing a 13 or even a 20wpm code test assures a lifetime ability to
copy Morse at any usable speed. I've seen too many examples of "cram &
pass" types who never actually used the stuff on the air to any extent
all but completely forget how to copy Morse. Apparently there is some
combination of both a speed and a number of hours of experience at
that speed which embeds Morse for life.

"Bill Sohl" wrote in part ...

So far the UK, Netherlands and several other countries have done exactly that. Once all code testing is ended by the FCC will you accept that action as supporting the FCC position that morse isn't needed to be a "fully qualified ham?" Additionally, I don't recall anywhere seeing any FCC reference to the concept of a "fully qualified ham". Is that a new license class?

I believe that a person who aspires to be an Amateur Extra Class *should* be able to send/receive Morse Code at a minmum level. You and I both know that even if testing for CW goes away, the mode will remain a very popular one in the ARS for a very long time. To me, at least, it just makes sense that a person holding the highest class of license should have a working (practical) knowledge of the second most popular mode we have.

It's even worse. She has no idea how to break a sine wave down into its components, nor anything about the 360 degrees involved. To say nothing about how voltage/current/impedance

values appear at each point on the waveform when it is expressed as a dipole antenna, and how
they interrelate. NOTHING about electrical wavelength versus linear measurement, or what that
even means..

All that is really quite simple and can be easily learned and understood with no help from NEC. It's antenna basics. But with the testing requirements now in place, it won't be.

>
> > That antenna is simply not going to work well at all.

Until she figures out how to match her 50 ohm transiciever output to several thousand ohms or
more.

But.....she isn't actually *using* a 1/4 wave dipole - she just thinks she is.
In fact she's sure of it. She said so.

Yup, my FT-847 can recieve & transmit 160M thru 2m except 60M plus 440
all modes out of the box and it'll fit under the dash. Ditto a number
of other current-tech xcvrs like the very popular IC-706, etc. If I
mod it to operate on 60M which is clearly a legal maneuver I'll also
be able to operate all over the VHF and lower UHF spectrum which is
clearly illegal.

That old Public Notice is the problem, it is not the solution.

I'm not trying to pretend at all. We're talking about two countries
with a little over 1,600 radio amateurs between them.

> You know where this will all end, and a d*mn good thing it is

You mean if it wasn't for you, you'd have been licensed and on HF at 14.
I was licensed for HF at 14 and I passed a code test. Don't blame the
test. Blame yourself.

Maybe I should get Clint to sked with me at 14.080 on CLOVER? Naw.....
there's not a chance he would have a HAL modem. Betcha he never heard of such a
device.

Maybe get him onto some soundcard digi stuff with PSK31, HELLSCHRIEBER OR
MFSK16? Maybe even plain ol' vanilla RTTY?

You think he knows what a sound card IS??

Maybe get his sorry arse off that ancient old retro SSB and into something
that actually *IS* modern?

Wind turbines don't have to be located in the back yard of the Safeco Field, Dee (Safeco Field replaced the King Dome). They can be placed on the other side of Puget Sound, where there is plenty of wind. Another alternative is some of the islands north of Seattle at the mouth of the Sound (also plenty of wind).

Compliance with all laws (or regulations) is a voluntary act. But, in this country, there is a mechanism for eliminating laws that no longer serve a purpose. That process is happening now with the regulations concerning Morse Code testing.

> Only NCTA whiners who are too lazy and indifferent
> to the true nature of the ARS to be bothered to learn
> a useful communications skill like Morse/CW drag out
> the "I'm being forced to learn Morse code" or "I'm
> having Morse code shoved down my throat" arguments.
> This is truly pathetic.

Attempts to prevent the process of ending code testing, with no reason other than your own preference for that testing, is indeed an attempt to force interested parties to comply with your wishes instead of complying with regulations which reflect the true needs of Amateur Radio. The only reason you've offered for keeping code testing is your desire to limit access to Amateur Radio (to keep out those who are not "interested, motivated, or incentive-driven" enough to meet your tastes). Of course, Amateur Radio was not created to be your own private club with rules designed to keep out those you don't like. Instead, Amateur Radio is open to all Americans with ANY interest in this activity, with rules to reasonably facilitate that safely and orderly. That interest is not limited to just Morse Code today. It also includes those who just want to hang out on the repeaters, those who just want to talk with their friends, those who just want to build their own equipment, and those with many other similar interests (and soon to include those interested in HF, but with no interest in Morse Code).

> (snip) This is the genius of the Morse code testing
> requirement -- it brings out the best in interested, motivated,
> and incentive-driven people, who, for the most part,

Your own ongoing behavior in this regard clearly shows that statement to be totally false.

>you'd also do well to make a case study of how many hams
>are represented by the nations that are dropping it. Many
>nations that aren't are composed of nations with fewer than
>a dozen hams.... and a few that are run by dicators
>(lybia) have 1 and only 1 ham operator.... guess who.....

Then tell us - how many hams are represented by the 8 nations that are removing
code testing? How many hams are there in Singapore, Switzerland, the UK,
Belgium, Germany, Austria, Netherlands, Norway, and Ireland...?

Here's the country to watch: Japan. They've had an HF license with no code test
for decades. (It's their 4th class license). And they used to have the world's
largest amateur population.

But about 1995 their numbers started dropping and they continue to fall. Why?

Some say it's the Japanese economy
Some say it's the Internet
Some say it's cheap cell phones
And some say it's the code test for the other licenses.

But Japan still has code testing. Maybe that will change.

(Note that Japan issues separate operator and station licenses. *Operator*
licenses are free and never expire, so the operator license totals never
decline. *Station* licenses have to be renewed and cost money (120 yen).
Station licenses are declining rapidly.

>
> Depends on which "back when".

Yep.

> My 5, 13 and 20 wpm code tests were all
> administered by FCC Examiners.

For 3 years (1951 to 1954), FCC gave Novice and Technician tests at
FCC exam points, and only those far enough out in the sticks to
qualify for Conditionals could take N&T by mail. In 1954, all Novice
and Tech exams became by-mail only.

However, it *was* possible to get a Technician at an FCC exam office.
There was a time when, if a ham attempted the 13 wpm code and did not
get the required 65 correct consecutive characters, but did get 25
correct consecutive characters, the FCC examiner would allow said ham
to take the General/Tech written and get a Tech if the written were
passed. (The "25 correct" were considered proof of 5 wpm). This was
also back when you could hold both Tech and Novice at the same time.

> And I took all of 'em one-on-one with
> the Examiners, never as a member of a group taking the same test.

My 13 wpm was with a group. 20 wpm was me and the examiner.
>

> > passed. All or nothing at all.
>
> Yup, yup . . . no slack. At all.

There was also a policy that tests given by mail did not count for
element credit. A Tech who had gotten the license by mail had to do
both 13 wpm code and the Tech/General written in front of an FCC
examiner in order to upgrade.

In fact, way back when, there was a rule that if a Conditional moved
to within the prescribed striking distance of an FCC exam point,
he/she had to retest for General within 90 days or lose their license.

Well, that kinda explains me, because I found block printing much
easier than longhand.

There's a particular form of block printing shown in "Learning The
Radiotelegraph Code" that uses a minimum of pencil strokes, resulting
in maximum speed and legibility. It was developed for the Signal

Corps. For example, most people block-print an E by making a vertical stroke and three horizontal strokes. The Signal Corps method is to make a square-cornered "C" (horizontal top, vertical, horizontal bottom) and then the middle horizontal stroke. Pencil leaves the paper twice instead of four times. Works.

> But after that?

You guys have managed to precisely describe what happened to packet radio, when packet/internet gateways were intoduced into the network, to "speed things up", and make it more "reliable".

Hams using HF to route messages over long distances would find that they could no longer send those messages because they were already there, forwarded over the Internet in order to "speed things up" and make packet more "reliable"...

As a direct result of this misuse of packet/internet gateways in order to "route around" hams using radio, an organized, global HF digital network, one of the most impressive accomplishments ever by hams around the world, was undermined and eventually destroyed. Dozens of digital HF stations around the world had to shut down, deprived of traffic while others were overloaded by tons of inappropriate overseas traffic shovelled into our VHF/UHF networks through the packet/internet gateways.

And, as you noted in your post, U.S. hams found the new non-ham network intrusion to be interesting *the first handful of times*, then they lost interest in packet altogether. It was no longer ham radio.

The packet/Internet gateways speeded things up as advertised, but in view of the fact that they undercut and eventually destroyed the network, they could hardly be said to have made the network more reliable on anything but a short-term, short-sighted basis.

In Europe, where it was illegal to impose non-ham networking into an amateur radio network, the packet network continued to advance and grow all the time that ours was dying away from lack of interest. Interest in the Internet is often put forward as a cause for the setback in the U.S. digital network, but it should be noted that European hams had Internet access during this time as well, and it did not have that affect upon them, despite the fact that they had cable access to the Internet long before it was common here in the U.S..

The difference was that the Europeans stuck with ham radio in their digital ham radio network, and we didn't. It's that simple.

The "series of automated digital systems that would insure perfect copy at both ends with no operator skill required" took the fun out of packet radio, here in the U.S., and that is why USPN considers non-ham networking to be off-topic, irrelevant to the business of rebuilding a digital amateur radio network here in the U.S., where the misuse and abuse of packet/internet gateways has already caused us so much damage, and has set us back so far.

Besides, there is the simple, no-brainer fact that you cannot provide emergency backup for a network that you are dependant upon. - Like a special number to dial when the phones go dead, systems such as EchoLink and packet/Internet gateways are inherently useless for emergency communications and do nothing to advance our understanding and use of radio, and so are ultimately irrelevant to our purpose as hams.

In the area of packet radio, we are making some great progress in eliminating this problem here in the U.S... Sad to say, the repeater folks may have to go through the same crippling slump and lack of interest before they too begin to clean up their act and get back to ham radio.

"Bill Sohl" wrote ...

That argument/claim found no favor in the past. The reality is that neither the FCC nor almost every emergency preparedness organization/operation has no desire or need for morse in their plans. Individual hams may make the claim, but they aren't executing the claim in the vast universe of RACES, ARES and other amateur emergency operations.

Where did you get your information, Bill? I have found the opposite to be true. Almost every EMA that I have contact with, has Morse code capability. My own agency has four HF sets and *each* one is Morse capable. Having Morse code capability is an asset to the EM package -- just one more tool available. Why in the world would anyone be against that?

Kim, I went to the web pages of Alpha-delta. On 80 meters the antenna uses something they call an ISO-RES coil. This is an inductor that they use to as they put it, "approximate" a half wave dipole. While this goes up in a shorter space, it is nothing more than a dipole version of the coil at the bottom of a mobile antenna, and used for the same reason.

They write:

The DX-CC utilizes the exclusive ALPHA DELTA ISO-RES coil principle for shortening and multibanding an antenna. The ISO-RES is not a trap, due to the fact that there isnï¿½t a trap capacitor being used. Thus, the DX-CC is a much lower "Q" antenna than one that would be constructed using true traps! This allows the DX-CC to be broader in bandwidth than is possible with a trap-type antenna of equal size. The lower "Q" also allows the user to employ a moderate range antenna tuner (matchbox) for achieving resonance and min. SWR anywhere within the covered frequency bands.

But it's just a coil. The antenna should work okay. Nothing special, but you could work the world if you were patient.

> websites with technical discussions are getting told--once again--that they
> are dumbed down.

I read them too Kim. what they say is that they use coils to load these antennas. that they take up a quarter wave of space is irrelevant. When there is a loading coil, call it ISO-RES or a "spiral coil" it is part of the antenna, and adds it's length to the equation.

> Sayin' it don't make it so.

You're right. Saying a half wave antenna stuffed into a quarter wave space with coils does not make it a quarter wave antenna.

> And, since that is the mentality that often
> develops with any kind of attempt at anything remotely "real" ham radio,

Wrong battle, Kim! I know you don't like Dick or Dan or some of the others in this discussion. But they are *not* wrong on this one. As I pointed out in my quick antenna design I did yesterday, a dipole antenna of a quarter wavelength long would have almost infinite SWR, a high takeoff angle, and just wouldn't work very well. This is not a personality issue.

> then that is why we "dumbed down" hams don't even regard this
> newsgroup as a place to try such conversation.

And I would be willing to bet that if approached nicely, lots of these guys and gals would be happy to share their knowledge. It always worked for me.

I'm a "dumbed down" Ham. I didn't get my license until 1999, and didn't learn morse Code until after they reduced the requirement to 5 wpm. And I've managed. Oh, there have been a very few that have been less than cordial at the start. But I'm such a nice guy that they all come around after a while and just think I'm great! (HAR)

Because the terms of their license make them responsible for the quality
of their radiated signal(s).

Without demonstrating some familiarity with the basic underlying
science, it would be irresponsible of the regulators to allow an
applicant to establish a radio transmitting station on the public
airways. Familiarize yourself with the concept "tragedy of the
commons".

In seing the overall preparation, drills, etc of vaious ARES/RACES which
don't include morse at all.

> I have found the opposite to be
> true. Almost every EMA that I have contact with, has Morse code
capability.
> My own agency has four HF sets and *each* one is Morse capable. Having

Having almost any HF rig made would include CW capability. That does
not, however, indicate morse is being used or otherwise integrated
into the emergency planning.
Even so, ending morse testing in no way
stops you or anyone else from learning morse, using morse or making
your emergency plans that might include morse.

> Why in the world would anyone be against that?

No one, certainly not me nor
NCI is against anyone USING morse if that suits your purpose.

Cheers,
Bill K2UNK

How about knowing Spanish, Chineese, etc...two of the most
popular languages used on the air after English?

Cheers,
Bill K2UNK

>
> Well, give that person a Nobel Prize for accomplishment in physics!

"that person"?

It's more than you had done in RADIO at that age.

And mine was legal. No bootlegging.
>
> By 1967 I'd already DESIGNED and mostly built (technician help was
> not always available) several UHF to microwave RF emitters of more
> that 10 Watts.

Well, give Len a Nobel Prize for accomplishment in physics!

In 1967 you were almost three times 14 years old.

And it was your JOB, wasn't it?

> All quite legal.

Not for you to operate unless you held the station license.

Guess what, Len? You can get an amateur license for VHF/UHF that
doesn't require a code test.
>

>public, such as these morning shows.

Ryan, I've been wondering the same thing for years.

All I get from the ARRL syncophants is a lot of excuses and rationalizations.

The only "news" the ARRL can spread is to other radio amateurs. It can't get some decent coverage in mainstream media unless it has a better spokesperson than Walter Cronkhite.

Last year the Los Angeles TIMES (a small local newspaper with a mere 1.4 million daily issues) covered model airplane events with more column-inches and photographs than amateur radio.

Interestingly, the membership of the Academy of Model Aeronautics ('AMA') has about as many members as the ARRL (about 170 thousand). The AMA lobbied for and got a whole new EM band for radio control years ago. The AMA doesn't purport to be any "pioneer" in aeronautics or any sort of entry level to aeronautics...they are just out to have FUN with model aircraft and like things in a hobby activity.

The best that the ARRL could do was come up with 5 channels on HF near 5 MHz. They haven't even agreed with the IARU on the code test issue, not even after WRC-03.

But, to hear the ARRL's own words (propaganda), they are at some kind of cutting-edge forefront of radio, "representing" amateur radio for "all" amateurs.
They are benevolent, noble, good and true and should never ever be faulted.
"Amateur radio would never exist without the ARRL" according to syncophants.

>My antenna is 96 feet total length, cut as a general purpose dipole. I
>use a tuner and ladder line to match impedence with my transmitter. But
>I would never name it a 1/n dipole.

Mike, it seems to have started when Dan adamantly defined a "dipole"
as a "half-wave."

A "dipole" is simple two conductors in the same axial line have close to
the same length for each of the two conductors.

The "feed" can be anything that is balanced.

The impedance at the feed point will vary depending on (in order):

1. Wavelength of the RF applied.
2. Height above ground.

3. Conductivity of the ground.
4. Influence of conductors within 5 to 10 wavelength from dipole center.

The pattern of the dipole will vary according to the same factors.

There is NO absolute rule that a "75 Ohm" (closer to "72 Ohm")
impedance MUST exist. Within a zero to about 2 wavelength distance
above ground, the impedance of a dipole at exactly half wavelength
will vary from zero to slightly over 120 Ohms resistive in a graphical
appearance much like a damped transient step-impulse waveform.

Dipoles do NOT have to be symmetric in conductor lengths. A certain
combination of unequal lengths allows some "broadband" properties, that
is, a greater frequency span within a certain VSWR limit, than a symmetric
dipole.

Vertical dipoles have different characteristics of impedance and pattern
than horizontal dipoles but both exhibit general similar behavior in
characteristic changes above ground.

In here, the characteristics of the "superior" (i.e., amateur extra class,
the
alleged "experts" in ham radio) vary widely with their elevation above the
terrestrial sphere. Some are so far out of orbit that all they can spout
are
some homilies learned long ago...their last vestiges of contact with the
rest of the human race. They can, however, do "CW" and thus they can
"get through when nothing else can," supposedly without electricity, power
transfer matching, or common sense.

Tell us some more LIES, girl.

We don't have any "energy mess" here.

California's energy gets disrupted once in a while by natural disasters.

We do NOT have they kind of debacle of power loss such as the recent northeast, many-state, greater-than-a-day outage...NOT caused by any natural disaster.

California HAS had some unscrupulous private energy company managers who tried to scam both subscribers and the state government in what amounted to a form of usury. The EASTERN press picked up on that and made hilarity of it.

The EASTERN press didn't make any hilarity about the recent many-state outages in the northeast, did it? Apparent cause was carelessness, not a natural disaster.

Of course not. The EAST can do no wrong.

Quite right, Dwight, but, to the rest of the newsgroup, the Greater Los Angeles area is a tiny, small settlement with nothing of interest to the national leaders on the east coast.

Never mind that California is the most populous state in the Union or is the real birthplace of modern semiconductor electronics or a leading supplier to the aerospace industry.

California DOES have some private power providers who tried to scam both the subscribers and the state government with alleged "shortages" and other nonsense. The Los Angeles DWP was NEVER "without power" or had any "brownouts" or "rolling blackouts" while serving more than 10 million with electric power.

>weekend for the Coast Guard. However, things have been fairly quiet so far.

Isabel promises death, destruction, and terror for all the USA according
to the major news sources.

Only amateur radio emergency radiomen using morse code can Save The
Day (according to ARRL propaganda).

We can all read about it a month from now on the ARRL site. Going to be
hard to find all that Hams-Save-The-Day in other major news sources.

Lose electric power?

Use CW!

"CW gets through when nothing else will!"

I don't know about Clint or Brian "feeling at home in any environment."

A half century ago I felt right at home working primary communications
on Army radio station ADA. Not only feeling that but BEING AT HOME
at the new site of Camp Tomlinson...barracks at one corner of the huge
antenna field. ADA never used "CW" (on-off keying), trans-Pacific or
local.

DICK, you've NEVER done that in the US Army, have you?

All you can do is demand that EVERYONE HAD TO DO IT LIKE YOU
DID but you can never offer any viable proof why they should.

Are all "elmers" PCTAs? If so, WHY?

You KNOW all elmers personally, right?

Why don't YOU continue to alienate and denigrate all the others who have
been on HF much longer than you, who have worked HF comm 24/7 longer
than you've been alive?

Since you aren't out getting ready for emergency work on Isabel, why don't
you start a petition for an RM with the FCC to make the 'ARS' the Archaic
RadioTELEGRAPHY Service.

Make it official. Quit making it offal.

>even if testing for CW goes away, the mode will remain a very popular one in
>the ARS for a very long time.

"Very long" is very subjective. It is as "long" as the extremes of the
actuarial tables.

If OOK CW is already so damn popular, why are you so insistent that a TEST
for it MUST BE KEPT?

>To me, at least, it just makes sense that a
>person holding the highest class of license should have a working
>(practical) knowledge of the second most popular mode we have.

It only "makes sense" when considering YOU are one.

If everyone else is of the same class, then you aren't either "special" or
"superior" anymore.

You seem to NEED the status, rank, title, and privileges of Amateur Extra
more than what all those privileges allow you to do. All you do is "work
CW?"

Everyone else has to do as you did...because...

Of course it "must be everyone else." Doesn't the Communications Act
of 1934 state that the abilities of US radio amateurs shall be founded on
the abilities of Arnold Macy?

>As to CW
>being archaic, well let's have your expert thoughts on those outdated and
>archaic modes known as Single Side Band, Amplified Modulation, and RTTY.

Morse code was first used commercially in 1844.

Absolutely NOTHING about single side band (sic), amplified modulation
(sic) and RTTY until the 1900s.

There were some attempts at TTY in landline use but those did not become
viable until around 1880.

"Radio" was first acknowledged as a communications medium in 1896 in
both Italy and Russia.

The only CW radio transmitters of 1900 were the rotary alternators that
could sustain a reasonably pure sine wave at radio frequencies with a
minimum of harmonic content.

Amateurs at the previous turn of the century (1900) could afford only the
damped-wave oscillator sources known as "spark." "Spark" is FAR from
a Continuous Wave source, being a combination AM-FM-PM of highly
variable and rather unstable RF which can ONLY be modulated by on-off
keying.

"Spark," that paragon of once-viable technology among amateurs, is no
ILLEGAL.

>I've noticed that the written exams still include material on each of them.

When did the "amateur expert" Arnie Macy last take an amateur radio test?

I can't find any VEC QPC questions on "spark" transmitters.

Are you still using a "spark" transmitter for amateur communications?

Remember that "spark" was once "viable technology."

>Surely you would be in favor of eliminating that irrelevant nonsense as >well, right?

I think you can eliminate all your irrelevant nonsense about trying to keep US amateur radio DUMBED DOWN to 1930s standards and practices.

Now, why in the hell aren't you OUT THERE as an EM person getting ready for Isabel's destructive landfall?

We can't read about Macy's marvelous savings of the day through ham band OOK CW on the ARRL news page if you don't get off the Internet and be ready for all those disasterous emergencies.

Tsk, tsk, tsk...self-promoting definition time again? :-)

That "clase" is called 'Amateur Extra' in the rules, DICK.

Nothing at all about the extra being "expert."

Note that the FCC specifically identifies that "clase" as AMATEUR Extra.

That "clase" has the most privileges of any of the three license "clases,"
DICK. That's all, nothing more.

The remainder of the "expertise" is in your fantasies.

Happy dreaming.

>
>Ushering in underachievment is notheing to be proud of, Bill.

Trying to hold amateur radio hobbyists stuck at 1930s standards and
practices is NOT something to be "proud of," Egbert.

Keeping amateur radio hobby activities stuck in the Past should require
you to petition the FCC for a separate amateur radio service...such as
the Archaic Radiotelegraphy Service.

But...there is NO way you can bring back the "viable technolgy" (that once
was a mainstay of US amateur radio) called "Spark." It is outlawed.

Note: "Spark" could ONLY work with on-off keying.

>> > > More to the point, is there any minimum code

>on the bottom of 40 or anyplace on 30.

Why don't you STAY in your "bottom ends" and play with radiotelegraphy?

Perfectly legal for you to do so.

Why bother the rest of the world with superfluous fantasies and gratuitous
denigrations of NCTAs who don't enjoy your fantasy land adventures?

>Just watch the unequal ground between the two when a seasoned CW op outpaces
>his phone op counterpart in a sprint for certain rare DX contacts.

Don't they always? To hear them tell it, of course.

Is contesting the ONLY activity of US amateur radio?

Isn't US amateur radio a SERVICE to the nation, saving the day in
emergency communications when absolutely all professional comm
facilities have been destroyed?

> Heck,
>I've read that some of them only work CW. Liken it to the race between the
>tortoise and the hare, but the tortoise KNOWS how to read the road signs and
>the hare is confused because "there's no pictures." Think it's a bad
>analogy, Bill? Try looking at the cash register keypad next time you go to
>McDonalds...the result of the very same mentality of underachievement NCI
>"actively made happen."

Egbert...a half century ago I was doing actual HF communications in the US
Army trans-Pacific as part of the primary communications link for the US
Far East Command. *NO* "CW" (on-off keying) modes were required or
used. 36, later expanded to 43 transmitters. HF. 24/7 operations.

NO "McDonalds cash register keypads" then.

The US military didn't go into "contesting." It was only interested in
national defense and preventing the Cold War from becoming Hot.

Why in the world do you keep harping on morse code as a
"requirement" for US amateur radio licensing?

Why are you trying to keep US amateur radio DUMBED DOWN to the
levels of 1930 and earlier?

LHA

>_____
>
>My EM Agency has multiple sets of HF gear and every one of them is manned by
>an ARS operator that is CW capable -- and we'd be foolish not to include
>that capability in our EM package.

Absolutely...nothing gets through like morse code.

Amateur use of morse code will always save the day.

Amateur radio will save/rescue untold numbers of hurricane victims.

>Now, don't get me wrong, I just love the new technology.

Anything invented/discovered after 1930 must be "new technology" to you.

>As a part of that, we have FM trunked radios, laptop
>computers, closed network capability, VTC Scotties, and SATLinks. IOW, we
>use *all* of the tools available to us.

But, more importantly, MORSE CODE SKILL is a NECESSITY for
emergency communications, right?

Of course it is. You MUST require all amateurs to KNOW morse code.

Morse code gets through when nothing else will.

That's why all amateurs are SUPERIOR to professsional communications
people.

"Real" amateurs KNOW morse code, therefore they are superior.

>Why not just admit that CW does
>have a place in the EM package -- or are you just so dug into your position
>that you can't see the sky anymore?

I'm not "dug in," just covered with all that bullshit shoveled by the PCTA.

> IMO, it's not necessary to throw out
>the older viable technology in order to embrace the future.

Newflash: "Spark" (damped wave oscillation) was once a "viable technology."
No longer. It is outlawed in the USA.

Don't worry...your crystal set will still receive signals. No electric
power
required.

Are you properly equipped with "viable technology" of crystal sets?

>If that were
>the case, none of us would ever use a hard-wired phone again.

According to the US Census Bureau, there are over 100 million cellular
telephone subscribers in the USA. There are over 150 million "hard-wired"
telephones in the USA.

What is the point of your little "viable technology" diatribe?

And why in the hell aren't you OUT THERE being ten kinds of EM
manager with impending doom/disaster from Isabel?

> the U.S..
>
> The difference was that the Europeans stuck with ham radio in their digital
> ham radio network, and we didn't. It's that simple.

I see it a little differently. People become hams for many different
reasons. Some of those reasons continue, while others have been taken
over by other communications methods. Not too long ago, if a "regular
person" wanted to communicate with distant friends and relatives, they
had very few options (post office, telephone, telegram) and none of
them were "free" - except amateur radio. Free email and the like has
changed that completely. In similar fashion, ~20 years ago it was
common for folks (around here, anyway) to get ham licenses for
"honeydew" comms. But with cheap cellphones, that's almost
disappeared.

The folks who stay are those who are attracted to radio as an end in
itself.
>

IOW, it stopped being about radio for its own sake. The message became
more important than the medium. Go down that road far enough and we're
all just emailing each other.
>

WELL SAID!

A big part of the attraction of amateur radio (for me, anyway, and
maybe for you) is being *independent* of the commercial/government
communications infrastructure. If the 'phones don't work, the radio
still does. Etc.

> In the area of packet radio, we are making some great progress in

I remember years ago when the first repeaters came on the air that
some of them got around the need for a duplexer by putting the
transmitter and receiver at different sites. And they were linked by a
leased phone line. For some reason that rubbed me the wrong way - and
now I know why. It was non-independent.

Sorry you see yourself as "dumbed down." I don't. I am no different than anyone else who's got a license--because I passed the requirements for the license I've got, and they did too.

Anyway, the web has the info; and you're right about the DXCC, I went back and read it. Guess the folks who say they are testing and using and pushing the performance of 1/4 wave dipoles should give up the concept of a fundamental of amateur radio: experiementation.

> is pathetic.

No, it's pathetic that some judge themselves, and others, based on something as outdated as Morse Code/CW. This was designed for communications in the early 1900's. By the late 1900's, it's usefullness as a communications mode had almost entirely disappeared. Today, it has no substantial use other than recreation. As such, it has no value as a license exam requirement. To claim otherwise simply because you've built a self-identity around that mode is truely pathetic.

In the end, look at yourselves before you start talking about what is pathetic. The two of you (Dan and Larry) sound like a couple of tired old CB'ers still arguing that D-104 microphones and tube-type linears were better as you sit around humming the tune to the movie "Convoy." You're too old to raise hell in real life anymore, so you instead sit around trying to raise hell in this newsgroup, patting each other on the backs for the imagined value of your skill while the rest of the world continues to pass you by.

Most Code/CW users understand the changing times and simply enjoy Code/CW for what it is - one more enjoyable operating mode in the rich diversity of Amateur Radio. Too bad you two can't come to grips with that.

"FCC nor almost every emergency preparedness organization/operation has no desire or need for morse in their plans."

I ask because you wrote the above. Why do you think the EM planners have "no need" for Morse? Any tool available should be considered for use in the EM package. Not only is our equipment capable of Morse, but we have CW capable operators for each. We've used it in the past and I strongly suspect that will do so in the future as well.

That would make those modes about 103 years old, Len. At what point do we start to consider them outdated?

>When did the "amateur expert" Arnie Macy last take an amateur radio test?

Since I'm a VE -- I looked at the current material about a week ago.

>Now, why in the hell aren't you OUT THERE as an EM person getting ready for Isabel's destructive landfall? We can't read about Macy's marvelous savings of the day through ham band OOK CW on the ARRL news page if you don't get off the Internet and be ready for all those disasterous emergencies.

Well, I must say that I have been quite busy for the past two weeks. The initial track of the storm was not looking very good for the SE United States. Fortunately for us, we were able to miss the bullet on this one. Of course you know that we *did* use that old stand-by Morse Code when Floyd came calling in 1999. SSB (you know, that 103 year old technology) was just not cutting it, so we went to CW until the condx improved. It's kinda hard to talk with someone 250 miles away on a handi-talkie.

This shouldn't take long. I shall use short words with few syllables so
that you can understand what I had said. Obviously you flew over it
without any REAL discrimination to the actual wording.

I never claimed you COULD send that with CW.
What I was saying is that the majority of the CW-using crowd is
trapped in a time warp that keeps them set back 30 years or so
(evident by thier "hell bent for leather" desire to keep cw testing
around), and wouldn't understand the concept of anything modern
(such as updating the various requirements in ham radio).

yep. well, there is no longer a 13 or 20 wpm requirement for a license, and soon there will no longer be a 5 wpm cw testing requirement. Then, people will get ham radio licenses and be ham radio operators WITHOUT having done it.

what's your point?

There is no reason for you to be exempted from the
> > same.

in your opinion. However, the opinion that counts is that of the fcc body itself, not you... and, eventually, just like with 13 and 20 wpm testing, they'll drop the 5. THAT is what will count.

I have this hilarious vision of elementary school students on a field trip to the local museum in the not to distant future... and they see a strange gismo on a table on the other side of a purple-fuzzy rope thing, covered with dust and cobwebs.... the museum director has to kindly explain to them, "that's a morse code key. It was used to send morse code signals many decades ago back when it was used as a means of communication.."

and a student raises his hand and says, "morse WHAT?"

< I snipped theother droll parts, but this I found interesting>

According to the US Census Bureau, there are over 100 million cellular telephone subscribers in the USA. There are over 150 million "hard-wired" telephones in the USA. What is the point of your little "viable technology" diatribe? And why in the hell aren't you OUT THERE being ten kinds of EM manager with impending doom/disaster from Isabel?

My point exactly, Len. Why waste all that money on hard-wired technology when we have nearly as many wireless phones already. Put that archaic technology to bed, right? Isn't that your mantra?

And once again, I really do appreciate your concern for my job performance. I'll make sure to tell my boss that you asked. :-)

[re: transmitting a 6 mega-pixel image]

> I never claimed you COULD send that with CW.

Well, actually, you _could_. I don't have all the tech stuff handy
to determine just how large a 6 mega-pixel 24-bit color image would actually
_be_, so let's just call it a 6 megabyte file, making it, what, 48 million
bits? Now, how many bits in a 'word' of Morse, average? A dozen, maybe? So,
sending at, let's say, 20 wpm gives us a hypothetical bit-rate of 240
bits/min or 4 bits/sec, so we come out with a mere 12 million seconds to
transmit the image (I _swear_ I did not intend for that answer to come out
that simple!).
It would only take 138.88 days.....

. . . I wonder how she'd tweak the length of her "quarter wave" dipole
if ya tossed her the free-space length equation and told her to crank
in the Vf term for a specific radiator material . .

> All that is really quite simple and can be easily learned and understood with no help from
> NEC. It's antenna basics.

Right: We were both Novices back when newbies had KNOW somthing about
antennas.

> But with the testing requirements now in place, it won't be.

OBVIOUSLY!

I dunno who it was who made the comment in this thread but he's right,
the more "quarter wave dipoles" these refugees from 27 Mhz use the
less QRM we have to deal with.

> > > That antenna is simply not going to work well at all.

> But.....she isn't actually *using* a 1/4 wave dipole - she just thinks she is.
> In fact she's sure of it. She said so.

Along these lines . . Field Day a few years back and one of the
codeless village idiots had put up some tribander or another which I
was using on 20 CW. I pointed it just south of due west from here in
Philly. To check things out I quickly worked a couple Euros, an OA, a
VK and a JA. Without touching the rotator control box.

I put the 259B to it and the SWR was flat at about 1.7:1 from 13.5 to
14.5 Mhz. I asked him what the hell kinda "beam" this crapper was.

"Well, it's not a CW antenna, it's tuned for the phone bands . . ".

I figger that pile of aluminum tubing at the high end of the coax was
acting as a top hat for the gawdawful lossy feedline which was doing
all the radiating.

Then came his buddy, another one, who stated that the reason g5rv's "work" is because they're "trap antennas". I asked him to show me the traps in the 40M g5rv we'd put up. "I don't know where they are but they have to be there somewhere."

N2EY was there too . .

And neither of us have been back to run FD with that pack of 21st Century nitwits.

Some years ago, when Hawaii got hit bad by a hurricane (or the Pacific
ocean equivalent word,
is it cyclone or typhoon?) it was on one of the national news shows
(ABC, CBS or NBC)
that hams were using 2 meter HTs to supply emergency comms between some
of the islands.

Another time a hurricane hit the Virgin Islands and law and order broke
down (looting and
such). Everything was out except for a few hams on HF, who told of the
situation to the
mainland. We sent in the national guard to restore order. And this was
mentioned on
network news to the public.

We do get some mentions, but we could use more....

> ago.

FCC PR Docket No. 91-36 MO&O Released September 3, 1993.

V. CONCLUSION [Emphasis added]

13. We hold that state and local laws that preclude the
possession in vehicles or elsewhere of amateur radio service
transceivers by amateur operators merely on the basis that the
transceivers are capable of the RECEPTION of public safety,
special emergency, or other radio service frequencies, the
RECEPTION of which is not prohibited by federal law, are
inconsistent with the federal objectives of facilitating and
promoting the amateur radio service and, more fundamentally,
with the federal interest in amateur operators' being able to
transmit and receive on authorized amateur service frequencies.
We therefore hold that such state and local laws are preempted
by federal law.

Footnotes

33. The rules, however, do prohibit amateur service
transmissions outside of the allocated amateur service bands.
47 C.F.R. Sec. 97.307(b); Public Notice, Extended Coverage
Transceivers in the Amateur Radio Service, mimeo no. 4114 (July
21, 1987)(noting that "[i]t is a violation of the Commission's

regulations to . . . transmit on a frequency allocated to a licensed service without the appropriate Commission-issued station license.").

The above proceedings are very clear that it covers only "out of band" reception and does not cover equipment that has "out of band" transmit capability.

Not being a real lawyer, although you try to play one, you may not accept the fact that in FCC practice, situations which are not specifically mentioned for preemption are not preempted. Adminsitrative Practice 101.

There has not been any challenge to this ruling, therefore it stands as effective law until overturned. Administrative Practice 102.

> KB5ZHT

Clint my man .....you should have followed your own advice and not posted that glittering generality of a Mongolian Cluster ..... I really think your are able to do better than that pathetic attempt to ruffle the CWist's feathers ... The fellows who I know who operate CW do so in addition to digital modes and various ones at that. I don't operate HF fone for various reasons but I can say in all honesty that the primary reason is that I talk all day. It is a refreshing break for me to get on an avocal mode and communicate with a fellow ham ....but Clint I know you also never operate fone as you know the superiority of digital modes and the inherent moderness therein.

God Bless 72&7/8ths Tom KI3R Belle Vernon Pa.

Beeping along since '65 amongst other things .....

That's where we started on this sorry thread. Go back and read the posts, including my 1/4 vs 1/2 wave dipole design done in EZNEC, and then let us know how well a 1/4 wave dipole works.

Then why don't you build a 1/4 wave dipole for whatever band gets you into Central PA. We'll do a sked, and see how well your antenna works.

No really, Clint. You seem to be the self-styled expert. You have strongly implied that anyone that is pro-CW is bereft of any knowledge concerning modern communications technology. So, put up or shut up. Explain to the group what a Scottie VTC looks like, how it works, and what additional hardware is needed for it to function properly. Once you've done that, tell us all about WANs, why they are superior to other types, and what additional measures are needed to make them secure. Then, since you seem to be the expert -- let me know which of the two systems you would recommend to my agency based on a long term cost analysis. And don't forget to factor in the yearly maintenance contract. I'll wait here, sport.

The local school district requires the students to learn no less than *three* different kinds of manual writing:

Block printing
Denilian (sp?) script
Cursive (longhand)

And they do it all by 3rd grade.

Even though the kids could get along with just one, all three are taught - and required.

>> >What engineering school did you graduate from, Len?
>>
>> One right here in Southern California...
>
>One without a name...:->

It's easy enough for a BSEE to find out. Not that many out here.

On the other hand, it is difficult to figure out WHERE YOU WORK,
in terms of an actual company name.

You rationalize on "not revealing it" for some kind of "fear" of getting
"bad mail" from others.

I think your REAL fear is just in everyone discovering you don't do a
damn thing in radio for a living.

No problem for me. I've revealed most of my employers in here, plus a
number of personal references who are long-time licensed radio amateurs.

You won't do that.

All you seem to want is some kind of "rep" in the newsgroup for being here
almost all of your free time, writing terribly long, boring peans to
yourself
and morsemanship...when not using the newsgroup as some kind of "chat
room" in talking about absolutely non-radio-amateur subjects.

>> >> IN the Archaic Radiotelegraphy Service...
>> >
>> >No such thing exists.
>>
>> Yes it do, de facto, just not de jure. :-)
>
>DeJur made projectors. You're projecting ;-)

I'm telling it like it is. "Archaic RadioTELEGRAPHY Service."

That's what you want.

That gives you some rank-status-privilege as an AMATEUR because
your aren't IN radio as a professional.

>> >I've been "in" the Amateur Radio Service for almost 36 years. You have
>> >not done so for even one day.
>>
>> >That's nice, Len. On what amateur band did you bootleg with it?

>>
>> I've never bootlegged on anything after 1948.
>
>Ah - but that means you may have bootlegged in 1948 and before!

YOU don't really KNOW if I "bootlegged" at all, do you?

All you want to do is to selectively use my messages as an ignition
point for a Flame War.

YOU didn't exist in 1948. That was 55 years ago.

You have NO KNOWLEDGE of what I did back then or even 56 years
ago, but you are trolling, trolling, looking for a Flame Fest to start.

So, great big expert radio ham, tell US your "personal experiences" with
small output personal wireless AM broadcast band links of the pre-1950
period.

>Come clean and tell the group all about it. It will be good for your
>soul to admit your checkered past.

Go stick a whouff-hong someplace, pervert.

It will satisfy your sex life.

>It's more than you had done in RADIO at that age.
>
>And mine was legal. No bootlegging.

YOU didn't exist in 1947...or 1948.

By February 1953 I was already (at 20 years of age) a soldier serving
overseas, assigned to an Army radio station with the callsign ADA.
I was with ADA for three years.

You've never served in the armed forces of the United States, much less
"assigned overseas."

You've made fun of my military service in the past. [that's in Google, by
the way, you seem to live part of your time there...]

You want to be honored a respected for being safely within in the USA
borders, never serving. You want to make fun of those veterans who
who don't love your blessed sacrament, morsemanship.

>> By 1967 I'd already DESIGNED and mostly built (technician help was
>> not always available) several UHF to microwave RF emitters of more
>> that 10 Watts.
>
>Well, give Len a Nobel Prize for accomplishment in physics!
>
>In 1967 you were almost three times 14 years old.

Wow, for an ALLEGED MSEE, you've got BAD arithmetic skills.

Three times fourteen is forty-two. 1967 - 42 = 1925.

I was born in 1932.

In early 1967 I was 34 years old, my Honorable Discharge was
7 years in the past.

>And it was your JOB, wasn't it?

You are damn right is was MY JOB.

I was good at enough to be given design responsibility.

>> All quite legal.
>
>Not for you to operate unless you held the station license.

Go Whouff-Hong yourself, sweetums. I DID have a station license
in the PLMRS (as its called now) in a partnership in a business.

Don't give us this CRAP about "holding a station license" when you've
stated in the past in here that ham radio is "all about OPERATING."

>Guess what, Len? You can get an amateur license for VHF/UHF that
>doesn't require a code test.

Guess what, Rev. Jim, you can become a REAL Preacher by going to
a theology school instead of playing the part in a newsgroup.

Then you give your sermons a real kick...the ones about the Sermon on
The Antenna Mount.

>Is it your guilt over your own bootlegging that causes you to attack
>those who followed the law, even as teenagers?

You are really REACHING for some Flame War, aren't you, Rev. Jim?

Why don't you pull out your Raddio Kop shield and come arrest me for
bootlegging?

>Who is this "Rev. Jim" you keep addressing?

Yourself, Stokey. Get off the hard stuff before it does you in...

>The age thing is yours, Len, not mine. You recommended that FCC not
>license anyone under age 14.

Let us know when you've passed the mental age of 14 and we can
discuss things rationally. So far, you aren't close to that.

>> >Why are you avoiding that simple question?
>>
>> WHAT "question?"
>>
>"Why should there be *any* written test on theory if all a person

>wants to do is operate manufactured radios?
>
>"If someone doesn't want to design, build or repair radios, why should
>they have to memorize all those symbols, diagrams and formulas?"

Those aren't "questions" except to the loaded, "do you still beat your
wife" sort of "questions."

They don't have to be "answered" because YOU don't have one single
bit of "authority" to demand answers.

Take pride in your work for a living. Reveal at least the area of
"electrical
work" you do.

I've never known anyone in electronics engineering to NOT take pride in
what they do or talk shop about it. You are the exception. You won't
say word one about what area of "electrical engineering" you are in.

Either you do NOT work in "electrical engineering" or you are terribly
ashamed of what you do that you don't dare admit it.

Either way, ALL you are is an AMATEUR who tries to pass hisself off as
a great big guru in AMATEURISM.

Show me up by giving an answer to that, Fearless Fosdick.

Bet you can't. You will weasel-word your way around it.

That's very incorrect, Hans Kohb.

Everyone knows that "CW" gets through when nothing else will, so
all that is required for amateur radio is to demonstrate on-off keying
morse code ability and that will suffice.

Right?

>I eventually passed code in 1993, but if it weren't for the *@#%^&! code >test I could have had an HF licence in 1971.

Alun:

The problem wasn't the "*@#%^&! code test" at all. It was you and your negative attitude toward it. The fact that you eventually passed it means that you had that ability all along, and just couldn't actualize it due to your negative feelings toward taking the test. I know; I've been there myself. The difference between you and me is that once I learned the code and began using it, I found it's value. This has served as the most convincing proof possible that code testing is a valid licensing requirement in the Amateur Radio Service.

Lennie:

Your half-century old experiences in military communications, where, by your own admission, you never utilized the Morse/CW mode, are irrelevant to the discussion of Morse code testing requirements within the AMATEUR Radio Service in 2003. In fact, as a person who does not use the Morse code for any reason whatsoever, you are self-disqualified from rendering any judgment on the topic whatsoever. Therefore, I suggest that you stop wasting your time, find something you know something about (which from my personal observation seems to be limited to megalomaniacal, ego-driven character assassination) and talk about that, instead. You are not influencing anyone on the topic of code testing.

In article <BAdab.33076$Aq2.2472@newsread1.news.atl.earthlink.net>, "Dwight Stewart" <stewartx@NOSPAMearthlink.net> writes:

> Compliance with all laws (or regulations) is a voluntary act. But, in this
>country, there is a mechanism for eliminating laws that no longer serve a
>purpose. That process is happening now with the regulations concerning Morse
>Code testing.

Dwight:

This may be so, but it is an imperfect system being directed by people with imperfect wisdom and questionable motives. I say questionable because their motives, for the most part, are entirely self-serving.

>> Only NCTA whiners who are too lazy and indifferent
>> to the true nature of the ARS to be bothered to learn
>> a useful communications skill like Morse/CW drag out
>> the "I'm being forced to learn Morse code" or "I'm
>> having Morse code shoved down my throat" arguments.
>> This is truly pathetic.

> Attempts to prevent the process of ending code testing, with no reason
>other than your own preference for that testing, is indeed an attempt to
>force interested parties to comply with your wishes instead of complying
>with regulations which reflect the true needs of Amateur Radio.

And it is my right as an American Citizen to make an attempt to preserve this requirement. I am not challenging your right to do the opposite, even though you seem interesting in squelching my own efforts. What are you afraid of?

>The only
>reason you've offered for keeping code testing is your desire to limit
>access to Amateur Radio (to keep out those who are not "interested,
>motivated, or incentive-driven" enough to meet your tastes).

That's hardly the "only" reason I've offered. I suggest a few nights spent on Google looking at my past postings.

>Of course,
>Amateur Radio was not created to be your own private club with rules
>designed to keep out those you don't like.

And, of course, that is not my intent -- only your "spin."

>Instead, Amateur Radio is open to
>all Americans with ANY interest in this activity, with rules to reasonably
>facilitate that safely and orderly. That interest is not limited to just

>Morse Code today. It also includes those who just want to hang out on the
>repeaters, those who just want to talk with their friends, those who just
>want to build their own equipment, and those with many other similar
>interests (and soon to include those interested in HF, but with no interest
>in Morse Code).

The interests of those desiring to simply "hang out on repeaters" is already
met with the No-code Technician's class license. And since the same
license also gives full access to ALL the frequencies above 50 MHz, all
of your other arguments lose their validity. HF access is different, and it
is here that the Morse/CW mode offers benefits and advantages which
can be exploited to the benefit of all radio amateurs -- but only if they
know how to do so. Therefore, the testing requirement remains current
and valid -- forever.

>> (snip) This is the genius of the Morse code testing
>> requirement -- it brings out the best in interested, motivated,
>> and incentive-driven people, who, for the most part,
>> become the best hams.

> Your own ongoing behavior in this regard clearly shows that statement to
>be totally false.

Another specious and unprovable argument, colored by your own
prejudice and self-interest.

Dan:

Precisely on point. The plain truth is, those who don't know the Morse
code and have not used it to a recognizably sufficient level of proficiency
are simply unqualified to make any judgments whatsoever about the
mode or the testing requirement therefor. The NCTA has nothing going
for them other than their passionate quest to become the lowest common
denominator.

I am not giving legal advice for pay or portraying myself as a member of the Oregon Bar so I can discuss the law and you can't do anything about it.

> although you try to play one, you may not
> accept the fact that in FCC practice, situations which are not
> specifically mentioned for preemption are not preempted.
> Adminsitrative Practice 101.

That isn't case law, that is a discussion by the FCC of ham radios that can receive out of band. To get my Icom 730 to operate on the WARC bands I had to modify it and it can even operate out of the box out of band.
If the FCC stated that the exemption does not cover any radio that is modified or transmits outside of allocated ham bands then you would be correct. But the fact that the FCC mentions reception in a ruling about ham radio transceivers that can receive out of band police or fire frequencies means that a ham radio operator can no longer experiment, improve or enhance his electronic equipment because Taliban Lawyer Phil says so is stupid.
Site the case law that proves that ham radio operators can no longer modify their amateur radios and therefore will be in violation of any Federal or State law.
Why don't you get your ARRL buddies to look at this issue and you can all send out a ARRL bulletin with a legal advisory? If what you say is true don't you think it is in the best interest of all league members to know this information? Especially since thousands league members have modified their ham radios to operate on 60 meters in the last few months.

Geeesh what a knuckle headed bunch. I never claimed that a 1/4 dipole would work as well as a 1/2 wave. However hook it to some ladder line and a tuner and you might be supprised. This all started when the so called "experts" here said there is no such thing. All I am saying is go to google and do a search and it will be obvious to the most casual observer that there is. Was I too fast for you are do I need to slow down?

It would be good to clear up a couple of things about California electricity generation, since the above really is becoming urban legend.

The assertion that no new power generation capacity has been built in California recently just isn't true. About 4.5 GW of generating capacity was added in the 1990's, and more since then. The non-renewable plants which have been built recently have mostly been natural gas fired plants, mostly because the technology for natural gas generation has made huge efficiency gains over the past couple of decades (and small plants have become as efficient as large ones, meaning you can locate them closer to consumers and save transmission costs too), making it about the most cost effective way to generate electricity until fuel costs began to rise even more recently. In recent years new coal and oil fired plants have produced more expensive electricity than natural gas (for equal emissions out the chimney)

when the costs of the plants are included, while I think the cost of nuclear power plant construction, maintenance and subsidies makes their output more expensive than even the non-hydro renewables (including wood!).

Also note that all but, perhaps, a lunatic fringe in California, would love to build more hydro plants. The problem is that to do this you need to get sufficient output from the facility to pay for the cost of building it, and the output from a hydraulic plant is proportional to the river's flow rate times the vertical distance from the top of a dam you can afford to build to the turbines at the bottom. A river's flow rate and topography are dictated by God, not by people, and unfortunately just about all the economic hydro sites in California have already been developed (Yosemite is an exception, I guess, but I don't think it is "wacko" to oppose flooding that).

As for the blackouts of 2000-2001 being caused by the lack of adequate generating capacity, I'd just point out that the system of generators which produced rolling blackouts in the winter of 2001 at a 28 GW demand level was pretty much identically the same system that comfortably met a 53 GW peak load on a hot day in the summer of 1999, so any theory that it was the lack of new generating capacity which caused the problem would also need to explain where 25 GW of existing capacity disappeared to. The fact is that much of it was taken out of service (by its new, post-deregulation owners) for "maintenance", an action which most now view as having a lot more to do with the ability of generators to make more money by selling less power in the new, deregulated market than it did with any immediate need for 20 GW of generating capacity to receive simultaneous repairs.

To tell the truth, while there are a lot of things I could find fault with in California, electricity generation and consumption isn't one of them. California has kept its per-capita electricity consumption almost constant over the past quarter-century, compared to a >50% per-capita increase in the rest of the country, while increasing its per-capita GDP at a rate substantially higher than the rest of the country, without any other associated pain or inconvenience that I can figure out and at prices that were, until recently, lower than, say, the US northeast. About 10% of the electricity comes from non-hydro renewable sources (there are about 6,000 wind turbines in the Altamont pass about an hour from where I live; I-80 passes through there). The response to the 2001 blackouts, and subsequent rate increases (probably assisted by the economy), was that California residents and businesses lowered consumption by 15% over the next year. If you look at http://www.caiso.com you'll probably find demand peaking at about one kilowatt per person on a summer day with temperatures in the urban areas ranging from the low 80's to mid 90's. I don't think there is anywhere else in the country that can match this, yet here it is done effortlessly.

I hence don't think there are so many negatives to be learned from how the construction of electric generation, and consumption of that power, has been managed in California. If you want to learn what not to do, I think the best lesson might concern how not to deregulate an electricity market.

In any case, for non-renewable energy sources I think natural gas still has big cost advantages over coal for equal emissions out the stack, while oil which, unlike the others, needs to be imported from unstable places, should be saved for those things which can't currently be done as well any other way (e.g. transportation). Natural gas is also a good substance to derive hydrogen from should we ever have the infrastructure to use it, this eliminating its greenhouse gas emissions as well. I'm not entirely opposed to nuclear power, particularly since its fuel costs tend to be uncorrelated with fossil fuel costs, but I think if you honestly added up the full cost of providing that power, including all the hidden government subsidies, you'd find it to be more expensive than just about anything else (I'd also be more impressed by their claims of safety if they'd buy liability insurance or self-insure, like all other power producers do, instead of threatening to close up existing plants and build no more if congress doesn't continue to reauthorize the Price Anderson Act's liability cap, yet another big subsidy). These days you can get more energy out of a pound of silicon, which is mostly just sand, then you can by turning a pound of nuclear fuel into really unpleasant stuff. And it mystifies me why people so commonly complain about the environmentalist wackos who want to keep oil reserves in the Alaska Wildlife Refuge from being exploited but have no comment or care about the Alaska politicians who have insisted the development of natural gas reserves in the existing fields, useful to replace declining production in other domestic fields, be tightly wrapped in a pork barrel straight jacket.

Of course, I may have been reading too much written by Amory Lovins recently.

It surely does but not many of them actually have anything to do with a quarter wave dipole. Many deal with comparisons between half wave dipoles and quarter wave monopoles.

While it is possible to construct a quarter wave dipole, such an antenna would be quite difficult to match and would not be very efficient. Despite this, our resident airhead, Kim, has come up with a number of urls which she is positive prove her case. She even thinks she is using a quarter wave dipole at home.

Kim is a ditz who knows nothing about morse code or antennas.

See my posting on that. The preemption only covered receive
capability. Gotta read the footnotes, too.

Don't get me wrong.....I, too, feel that if it is not -used- to
transmit, it's no one's business, but until and unless the situation
is clarified, it is what it is.

If you were to ask me if an automobile proceeding down Main Street
needs a rider on a horse to proceed it with a blue lantern, the
answer might be "yes" if the old ordinance has never been removed.
That doesn't mean that I agree with it, or that the ordinance is not
stupid - it means that that's what it still says.

>Today there are several HF/VHF rigs that can do so. IC-706 >has 6m and
>2m, several other HF rigs now cover HF plus 6, 2 and 440.
>In all the cases of harrased hams (harassed by police) in states with

>always listening to..not transmitting on, police frequencies.

It's time for the Five Gnomes to revisit the situation - as if they
know what we are talking about. We all know that ham radio issues
are not high on the Totem Pole at the FCC any more.

> Here in NJ we finally changed the old state law around 1994.

My rock-bottom stance is that such statutes should clearly indicate
that what is prohibited is radio equipment used in connection with
illegal activity - nothing more. That is a legitimate law
enforcement objective, and does not involve the law enforcement
officers (who are not qualified technicians) in determining if the
equipment has been modified or whether it has the capability of
transmitting and if so on what frequencies.

>posts, including my 1/4 vs 1/2 wave dipole design done in EZNEC, and
>then let us know how well a 1/4 wave dipole works.

Did you pay Roy for your copy of EZNEC or are you one of the software
bootleggers who steal from Roy Lewallen's work?

Do you know how to operate EZNEC properly?

> Then why don't you build a 1/4 wave dipole for whatever band gets you
>into Central PA. We'll do a sked, and see how well your antenna works.

Why don't you write a Famous Paper on "Why a 1/4-Wave Dipole Will NOT
Work" and have it published in RF Design magazine? [that's an electronics
trade publication, usually well-respected among RF industry folks]

I'd love to see the Letters to the Editor section on that one.

You never had me "killfiled," hypocrite.

You were busy "working to track Isabel for a year" or something similar.

You never did check out a working US Army field communications center
or even investigate the how and why of US Army comm use when you
were supposedly working for the US Army. You had ample time to do so.

But you never did and you had far more/easier access than most.

You must have found out an awful truth...that the US military does NOT
use any morse code for communications now!

Poor baby. Still bitter about that, huh?

You are trying to turn that bitterness around by making up more BS
about the morse code.

Doesn't work, Ah-nold...you aren't the Codinator from the future.

You are only carrying on a relic of the past.

"Ahl be back."

>technology to bed, right? Isn't that your mantra?

No. I just want to toss the morse code test in the dumpster where it
rightfully belongs.

As to technology, you seem to think that anything invented/discovered
after 1933 as "high tech."

You've proved yourself woefully IGNORANT of radio technology twice today
by claiming "SSB is 103 years old."

This isn't 1912 and the year of the Titanic disaster. Radio has improved
since then. Most radio amateurs have improved since then. You don't
seem to have learned anything correctly.

>And once again, I really do appreciate your concern for my job performance.
>I'll make sure to tell my boss that you asked. :-)

I'm not "concerned" about your "job performance." If you are taking money
from the USA for your "EMA" task, then I'd say you are busy Fleecing
America. Here you are claiming all that "hard work" and you are busy
Internetting while Isabel makes landfall.

You are a half century behind on demonstrated knowledge of radio
technology and what you have learned seems to be all wrong as far as
chronology is involved.

>What in the world are you talking about, Len?

The Archaic Radiotelegraphy Service, better known as the "ARS."

You are such an important "EMA" or whatever during a major
hurricane and you are playing in the newsgroup?

>BTW, thanks for mentioning Isabel. We *have* been working very hard
>tracking her and making preliminary preparations for a possible evacuation.

You are now in NOAA?

Good grief, there's no end to the stories you make up.

>Fortunately, we didn't have to implement them this time around.

Why don't you PRACTICE?

Keep up those morse skills. Be ready to deflect the hurricanes with
rapid-fire 20 WPM code! Save lives and property by being radio
amateurs! Get mentioned in the ARRL newsletter.

And get forgotten by the major press even now IN the path of Isabel
reporting and using newfangled communications equipment called
"portable television" and "satellite communications."

>But thanks for caring about my job. It's touching, really.

I care less what you do.

You've made so much BS in here about your professional amateurism
that there's no believing what you say. I doubt you were ever an Army
civilian doing criminal investigation.

By all means, keep up with the Living Museum of Morse and Radio-
telegraphy.

It must please you greatly to keep the ARS DUMBED DOWN at the standards and practices of 70 years ago.

To WHOM?

YOU don't regulate US amateur radio. The FCC does.

>> "Very long" is very subjective. It is as "long" as the extremes of the
>> actuarial tables.
>
>As long as people use, it will survive. SSB is a good example of that. 103
>years old and still going strong.

You are still IGNORANT of technical details, senior.

Radio as a demonstrated communications medium wasn't demonstrated
until 1896. That was 107 years ago, done in both Italy and Russia that
year.

SSB on radio wasn't really proven until 1928 (75 years ago) and the
commercial communications service providers did it, not amateurs.

>> If OOK CW is already so damn popular, why are you so insistent that a
TEST
>> for it MUST BE KEPT?
>
>Not *if* CW *is* the second most popular mode in the ARS.

Invalid, Billy Beeper. The only source for that "statistic" is the ARRL
and they are notoriously pro-morse.

Newcomers don't "owe" the ARS any damn thing and aren't obliged to
be "ruled" by long-timers. Try to grasp the reality of that, morseman.

>> >To me, at least, it just makes sense that a
>> >person holding the highest class of license should have a working
>> >(practical) knowledge of the second most popular mode we have.
>>

>> It only "makes sense" when considering YOU are one.

>proficiency.

That's only your OPINION, sweetums.

[ever hear that before? you just used it...]

>I don't need any status or rank. I worked my way up the ladder like
>thousands before me. That doesn't make me any better or worse than anyone.
>It just means I was motivated to succeed -- and I did.

Oh, wow, another "Dr. Phil" of the ham airways! B F D

EVERYBODY HAS TO DO LIKE YOU DID. BECAUSE...

Amateur radio is a HOBBY, senior.

It isn't a job, isn't a guild, isn't a profession (just the opposite, that's
why
it is called AMATEUR radio). It isn't a branch of the US military.

Everyone has to WORK up to it? WHY?

To satisfy WHOM? YOUM?

Who died and made you chief of hobby radio judgement?

Stuff it.

Now go play in the rain with your emergency comms code key.

Well "he" did.

What's the matter, sweetums, can't handle two at one time?

Too fast for your limited 20 WPM BS throughput?

>I will say this, though. He sure does admire you.

Sorry, bastard parrent, Clint and I are not related.

We happen to agree on tossing morse code testing in the dumpster where
it belongs. So do thousands of others.

>Are you sure y'all aren't related?

We are "related" as much as you and I are "related."

You never did look into a deployed brigade or regiment signal center
when you were working (as a civilian) for the US Army.

Never did have the guts to look in, did you?

You still haven't answered why you are busy Internetting when your
mighty macho morsemanship is so sorely needed in hurrican emergency
comms.

Not too busy to play in the newsgroup...bragging up a storm.

>The
>initial track of the storm was not looking very good for the SE United
>States. Fortunately for us, we were able to miss the bullet on this one.

I've just seen some various network news video of reporters out IN
the Isabel landfall area using all the newfangled video and radio and
stuff that you must think "won't work" in a storm.

>Of course you know that we *did* use that old stand-by Morse Code when Floyd
>came calling in 1999.

Of course you did, saved hundreds, thousands of lives and property by
using high-speed morse to deflect Floyd.

Any more mythology you want to repeat?

>SSB (you know, that 103 year old technology) was just
>not cutting it, so we went to CW until the condx improved.

You are technically ignorant senior.

"SSB" in radio dates from about 1930 so it is merely 70 years old.

Amateurs never really used it on any large scale until after 1950, that being 50 years ago.

>It's kinda hard to talk with someone 250 miles away on a handi-talkie.

Not a problem, poor baby. You've never done any Space Station or Shuttle contacts with an HT, have you?

Couldn't connect your morse key to an HT, senior?

How about flag semaphore? Night semaphore with lighted torches?

That worked well in the US Civil War...and the crossed flags with torch
at the center became the collar insignia of the US Army Signal Corps.

Signal Corps LONG AGO abandoned flag and torch semaphore and
doesn't use morse code for communications anymore. [are you keeping
up to date on your former employer, the US Army?]

>Not only is our equipment capable of Morse, but we have CW
>capable operators for each. We've used it in the past and I strongly
>suspect that will do so in the future as well.

Great! You helped save the Titanic and now you are ready to save the
Titanic II.

Why in the hell are you busy Internetting when Isabel has hit land?

Afraid of getting your code key wet?

ATTENTION USENET VISITORS, THIS AREA HAS BEEN DECLARED A TROLL
WILDLIFE REFUGE. TO LEARN ABOUT THE TROLL, ITS HABITAT, AND
ITS WAY OF LIFE, PLEASE READ THE SIGN-POST BELOW. IF YOU WOULD
LIKE TO LEARN MORE ABOUT THE TROLL, YOU CAN PICK UP BOOKS AND
SOUVENIRS IN THE GIFT SHOP AT THE END OF THE TOUR. THANK YOU
IN ADVANCE FOR OBSERVING ALL TROLL WILDLIFE REFUGE RULES, HAVE
A NICE DAY.
****
****

| Common name: Woodland Troll |
| Scientific name: Trollus Useneticus |

##########
# #
PHYSICAL CHARACTERISTICS:
# #
The common woodland troll (Trollus Useneticus) is an
approximately 1.7m long nocturnal furry creature that
has been found to exist in nearly every climate and
latitude. Predominant features include: a very pale

```
# complexion, a large bony ridge above the eyes, a dense #
# cranium, dragging knuckles, and a pungent odor. #
# #
#################################################################################

#################################################################################
# #
# HABITAT: #
# #
# Most trolls spend the daylight hours under a large rock #
# sleeping. Unfortunately, the natural habitat of the #
# troll has been encroached by development (as is all too #
# common these days). The modern troll has to make due #
# with a slimy, moss covered rock. Often, trolls are #
# forced to endure poor sanitation and filthy living #
# conditions. Combined with the general lack of hygiene #
# among trolls, this results in a very unpleasant odor. #
# #
#################################################################################

#################################################################################
# #
# ACTIVITIES AND DIET: #
# #
# During their active period at night, the common troll #
# engages in numerous activities, though the most #
# important of these is foraging for food. The one #
# characteristic that ties all different troll species #
# and sub-species together is their diet. Trolls #
# invariably survive off of a combination of cheetos, #
# arguments, and annoying others. A typical troll #
# requires approximately 10 arguments and flames per day #
# just to stay alive. With the increasing use of #
# killfiles and just regular ignoring of trolls, it has #
# become more and more difficult for trolls to eke out a #
# basic sustenance. #
# #
#################################################################################

#################################################################################
# #
# KNOWN PREDATORS: #
# #
# Unfortunately, trolls have many predators. Most common #
# among them are the helpful researcher, the informative #
# poster, the cool headed responder, and the kill-filer. #
# The cool header responder is technically not a troll #
# predator however. Trolls are typically unfazed by #
# logical counter arguments and cool headed reason. #
# However, even though their posts do not deliver the #
# same level of sustenance that a "flamer" or an "annoyed #
```

```
# poster" may provide, they still provide a valuable #
# source of dietary fiber for the troll. #
# #
# The most dangerous predators for the trolls are the #
# helpful researcher, the informative poster, and the #
# kill-filer. The common troll is highly allergic to #
# fact, real data, and research. Upon skin contact with #
# actual hard evidence and real data, the troll will #
# experience intense itching and burning at the site of #
# contact, followed by lesions and blisters. Eventually, #
# this results in loss of skin near the area of contact, #
# and usually to loss of a limb (in the example of #
# contact near the arm or leg). Contact with facts and #
# data near the facial area usually results in a slow #
# painful death. Contact with extremely high doses of #
# fact and hard data can cause temporary loss of #
# consciousness and even permanent brain damage for the #
# troll. #
# #
# The kill-filer poses a much more insidious threat to #
# the troll. Not posing a direct threat to the troll per #
# se, the kill-filer simply deprives the troll of yet #
# another source of nourishment. Some trolls have #
# developed counter measures to thwart the kill-filers, #
# usually this takes the form of a type of camoflage. #
# #
# The trolls' predators have reaped a terrible slaughter #
# over the years, resulting in the death of great hordes #
# of trolls. Trolls continue to breed rapidly though and #
# their population is stable. However, it is unknown how #
# long this situation can persist. Eventually, natural #
# predators and poachers may result in lower numbers of #
# trolls. Already we are seeing lower diversity among #
# the different troll species. That is why this troll #
# habitat refuge exists, to ensure the preservation of #
# the troll for not only our future, but the future of #
# our children. #
# #
#################################################################

============================================================
/ This troll habitat refuge has been paid for in part by /
/ the anti Troll-Defamation League, the International /
/ Society for the Advancement of Trolls, and the Troll /
/ Habitat Preservation Alliance. /

Source record: 77942

So then it would be necessary for someone who was being checked to cause his radio to make an illigal transmission before it could be determined whether or not he was "preempted". Nonsense.

That section says nothing whatever about the capability of the gear to transmit, only receive. Since the "scanner laws" specifically cover recption of police radio signals with an intent to prevent their criminal use, they don't address transmission in any way.
Phil I almost always agree with your point of view, but I believe you're wrong on this one.

4382. 1/8 Wave Dipoles will work

Newsgroup: rec.radio.amateur.policy
Date: 2003-09-19 04:25:38 UTC
From: wa8ulx@aol.com
Message-ID: <20030919002538.24386.00000885@mb-m16.aol.com>
Source record: 77943

just as good as 1/4 Wave Dipoles, with 1 advantage, you will not need as much wire or space to install it. A tuner is probably helpfull, but many people report a good match can be obtained using RG-58. It appears the best way to get a match using coax is to, coil about 8' of Coax at the back of the rig and the same at the fed point.

In article <20030918225804.11891.00000934@mb-m11.aol.com>, yodoc@aol.comnospam (Larry Roll K3LT) writes:

>Your half-century old experiences in military communications, where, by
>your own admission, you never utilized the Morse/CW mode, are irrelevant
>to the discussion of Morse code testing requirements within the AMATEUR
>Radio Service in 2003.

No more "irrelevant" than your constant BULLSHIT about morsemanship.

EVERYONE ELSE in radio but certain amateurs, maritime radio included, have dropped morse code modes. Morse doesn't work well enough for communications...doesn't really "get through when nothing else will" and isn't a "universal language."

I've been far more INVOLVED with civilian communications than any early military radio. On the engineering level, not as an amateur hobbyist.

>In fact, as a person who does not use the Morse
>code for any reason whatsoever, you are self-disqualified from rendering
>any judgment on the topic whatsoever.

Hey, like you are "qualified to land any human resources (personnel) job because of your alleged high grades" and wind up driving a BUS?

Like you've NEVER worked any military communications in your entire TWENTY except a telephone on your desk?

Tell me all about your "qualifications" for judgement about anyone, big shot. You seem to forget all the BS you were spouting about "summa cum laude" and "landing any (important) job you wanted." You wound up DRIVING A BUS.

You NEVER HAD to do military communications 24/7 anyplace so ALL you can use as a judgement reference is as an AMATEUR, playing around in a radio hobby, bragging up a storm like you were Marconi himself.

Roll, you are RETROGRADE as an AMATEUR. All you want to do is to keep everyone else in amateurism DUMBED DOWN to 1930s standards and practices.

That's all you are "qualified" to do, Roll. Spread RETROGRADE BS to all newcomers.

>Therefore, I suggest that you
>stop wasting your time, find something you know something about (which

>from my personal observation seems to be limited to megalomaniacal,
>ego-driven character assassination) and talk about that, instead.

Ho ho ho!

Boy, you lookin in da mirro again when makin messages! :-)

Where is that big "human resources" job you said (so many times) you
could get?

You can't even get anyone to do a PSK31 contact with yet you make all
the 1930s noise about morse code!

Roll, despite your snide EGO in over-drive, I've not only done what I say
I've done, but I have the references and the proof, including being friends
with radio amateurs who can testify as to what we did.

All you have after a twenty in the USAF and that alleged degree (where you
said you could get any personnel job you wanted) is driving a BUS.

>You are not influencing anyone on the topic of code testing.

You are beyond "influence," Larry Ego.

If you had all that personal "power" and "moral resolve" you brag about
having, then you COULD have gotten a good job in personnel and worked
your way up. You didn't. You opted OUT. Took the EASY route. No
strain, no pain.

All you are is an AMATEUR at a level of the 1930s standards and
practices in amateur radio. No more. Your BS doesn't work. All YOU
are "qualified" in is hoop-jumping to old, old rules, and shoveling manure
with your degree showing.

Thank you for that, Dennis!

I can only add that our Southern California DWP (Department of Water and Power) *never* had any brown-outs, blackouts, or electric power shortage during the private e-power scams elsewhere. Our DWP was actually selling electric power to the rest of the Pacific Intertie while that bogus "shortage" period was supposed to have happened.

>I hence don't think there are so many negatives to be learned from how
>the construction of electric generation, and consumption of that

Nobody seems inclined to mention anything about the infamous multi-state, multi-day power LOSS in the northeast quadrant of the USA. NYC totally blacked out, loss stretched into Canada.

No natural disaster cause. Still under investigation, but likely cause is eastern POOR PLANNING and OPERATION.

Hasn't happened that way here. Government-run electric power generation in the Pacific states had plenty of electric power all along.

Well, Well...Lennie is still touting his BC610 babysitting experience as
being (= / >) ham radio, hmm??

While he was sitting around twiddling his
thumbs and waiting for a breaker to trip so he'd have something to do, I was
busily involved in operating AND REPAIRING one of the very first video tape
systems in the country, among many other very interesting work activities at
the Signal School at Fort Monmouth.
You see, instead of sending me to an obscure, remote MINOR outpost about as far
away as it's possible to be sent, when I finished electronics training, the
Signal School kept me there as permanent party, to work as a broadcast

engineer at the educational TV station ran by the school. A most interesting and challenging assignment, indeed. I would have been completely happy to have stayed there for the remainder of my term of service, but my name came up for an overseas tour of duty rotation, so off to Europe I went after a year and a half.

I sure do feel for poor ol' Lennie, tho, he must have had a rough go of it 'way out there in the JA boondocks with nothing to do but listen to the transformers hum and wait for another overload. And I hear those BC610's didn't overload all that often, either. Tsk, tsk.

What a chutz-putz!

Yoiu might get some really noisy arcs inside the tuner, too.

I would think you'd know that ladder line and a fixed dipole, while they will work well on a wide range of bands and frequencies, are not the cureall for all ills. Attempting to match a dipole at it's highest natural impedance point isn't even close to "good engineering practice". It isn't even good "poor engineering practice". There are antennas that just can't be adequately matched and this is one.

You can always call a dipole whatever you want it to be. A halfwave dipole at 40 meters is a quarterwave dipole at 80 meters, if you want it to be that way. But it sure isn't very smart. And don't expect it to work out.

The real point was that she had no idea what she was actually using. It sure wasn't a 1/4 wave dipole.

I've been a ham for only a month now, and been using these groups for about 6 weeks.
I really can't stand some of the things that go on here.
Has anybody ever noticed that 8 out of 10 threads on this group (and many other amateur radio groups) end in a flame war?
It's really shocking how people can start an argument over nothing which can escalate to vicious strings of insults complete with profanity, sexual references and terms such as "CBplusser" and "Knuckle-Dragger". It's just unbelievable to me that while all of the books talk about how wonderful and helpful hams are, a significant number of them spend their time cutting each other down over random issues. I see "newbies" come to these boards for help, and get cut down by inconsiderate jerks who just feel like making people feel stupid. How many hams didn't start out with a lower-level license? People need to stop beating up on us poor no-coders. Don't they realize that the new people look up to the old-timers? I must say that after reading books about how hams help people all over the world and are generally just a wonderful bunch, these groups have really changed my view of the amateur radio community. I don't doubt that even this thread will end in a violent exchange of profanities and become just another flame war.

I'm afraid I just can't manage a 73 right now.
-KG6SGY

My e-mail address is real; just take out the ".TAKETHISOUT."
(obviously).

Greg if you want to see how all this began just spend some time in Google and you canget an educaion. It sure didn't start by old timers belittling newcomers. In fact it was and IS the exact reverse. Not all newcomers, by any means, just those on this board who decided to do it, and persist to this day.

> It's just unbelievable to me that while all of the

You're making assumptions here that shouldn't, indeed can't, be made. The jerks who show up her complaining about the code test requrement and blaming all us who just did it, without complaining. That in so doing learned that Morse code does indeed add substantially to ham radio, to the point that we believe code testing has a permanent place in ham radio, is just so much nonsense to them. They already know all about it.

> How many hams didn't start out with a lower-level license?
> People need to stop beating up on us poor no-coders.

Come into ham radio with a proper attitude (note I didn't say THE proper attitude) and you'll be received just as well as anyone ever was.

> Don't they
> realize that the new people look up to the old-timers?

You REALLY must have not been reading here very closely at all, Greg. Were that the case *here* you wouldn't have a report to make.

> I must say that
> after reading books about how hams help people all over the world and
> are generally just a wonderful bunch, these groups have really changed

> my view of the amateur radio community.

Don't feel lonesome.
It sure changed my view of ham radio, too. I showed up here several years ago to engage in civil, sincere discourse on the merits of code testing, and was immediately set upon by the code haters for my views. It's been all downhill from there.

> I don't doubt that even this
> thread will end in a violent exchange of profanities and become just
> another flame war.
>

Once again, you will get the treatment you deserve here, at least from me.

So far you're doing OK, I don't blame you for your concern. But I suggest you might benefit from a bit more knowledge of the background of what has happened here.

Ok. Since it was me who said there is no such thing as a 1/4 wave dipole, I'll modify my statement to read "There is no such thing as a 1/4 wave dipole other than at the station of a clueless ham who knows no better".

That should take care of it.

Thank you for responding.
I know that it is unfair to draw generalizations about the amateur community from posts on a newsgroup. And I am not trying to say that it's the old-timers who are causing all the trouble. I'm sorry it came out that way (and I realize that it's mostly the immature jerks, not the old-timers, doing the name-calling). It just gets me really depressed to see that well more than half of the posts in this group have nothing to do with the hobby, and were written for the sole purpose of hurting other people.
I would like to state that, despite being a no-code tech, and despite the fact that learning morse is the only thing keeping me from a general-class license, I support the code test. I agree that ham radio has drastically "dumbed-down" over the past several years, and I agree that it's not good for the hobby. However, I hate it when I see people looked down upon simply because they're lowly technicians. I hate seeing the "code/no-code"-related flame-wars that erupt every day. If people confined their comments to civilized discussion and debate, we wouldn't have this problem. There will never be a total agreement as to whether the code requirement should be dropped, but there's no reason for people to express their opinions like raving lunatics. People who just want to exchange clever insults should find a different newsgroup.
On a side-note, I have not ever been insulted by any member of this group. I am basing my opinion solely on the threads I read every day.
I hope I have not offended anybody by what I have posted so far, and I encourage further response.

Worst of all is how almost everything degenerates into a code/nocode debate,
sooner or later.

Utterly disgusting!

>
> The problem wasn't the "*@#%^&! code test" at all. It was you and your
> negative attitude toward it.

Only partly true. My negative attitude I freely admit. However, I had no aptitude for the subject, and still don't. Who knows why I should be good at science and languages, and yet lousy at woodwork and CW, and yet it's so. Each of us has innate abilities in some things, balanced by innate incompetence in others, i.e everyone is unique. I feel that this has been ignored by the pro-code side of the debate, or rather that it is known damn well, but none of you will admit it!

It is possible to learn something that one is no good at in order to pass a test, although unlikely that practical fluency in the skill would ever be acheived. It is even possible to learn something that one is both no good at and has no interest in, although much harder, and then the level of difficulty becomes crushingly hard. This is true of any skill, and interest is, if anything, maybe more important than ability, but any schoolteacher will tell you that when neither are present in even the snallest degree the chance of success is slim to none. So it was with me and Morse code. I did it eventually, with a huge amount of outside help, without which I would never have succeeded on my own. The reason I didn't succeed earlier is straightforward - I didn't get help before.

So there it is. I have a negative attitude, coupled with zero aptitude, and have never heard any convincing argument in these last 32 years as to why I should have had to have done it in the first place. Sure, I've heard lots of lame excuses as to why there should be a CW test, but nothing even approaching anything beleivable. No doubt CW is very useful, but I am no bloody good at it, and I prefer to actually _talk_ on the radio in the first place. That's all. No PSK31, no SSTV, no RTTY, etc. Boring and limited to some, but if you prefer CW or PSK, or WHY, then you're welcome to use them.

Then all the stories in the LA Times, CNN, MSNBC, etc etc are
themselves "LIES", Lennie?

> California's energy gets disrupted once in a while by natural disasters.

Uh huh...And the MAN-MADE disaster of too many people in too
small an area, unless YOU are now more knowlegeble about such matters
than those quoted by the aforementioned GENERAL news media?

> We do NOT have they kind of debacle of power loss such as the recent
> northeast, many-state, greater-than-a-day outage...NOT caused by any
> natural disaster.

No...You just have some of the highest energy-per-capita rates,
brown-outs, and air pollution that kills. The "routine" stuff.

> California HAS had some unscrupulous private energy company managers
> who tried to scam both subscribers and the state government in what
> amounted to a form of usury. The EASTERN press picked up on that and

Why shouldn't they? It was the truth. Ooooops...I forgot, YOU
have a hard time with the truth...sorry...I forgot...

> The EASTERN press didn't make any hilarity about the recent many-state
> outages in the northeast, did it? Apparent cause was carelessness, not a
> natural disaster.

No one in ANY press market has made any "hilarity" out of any
such energy related crisis, Lennie.

If you think anyone was laughing, it was your own puny mindset paranoia bugging you again. Seems it's been doing that a lot lately, huh, Lennie...

Been keeping an eye on street traffic lately??? That FedEx or Bustr Brown been around once too often for your tastes...?!?! How about air traffic...Has that "news helicopter" been over your neighborhood a bit too low and too frequently, Lennie?

> Of course not. The EAST can do no wrong.

Yet another LennieRant implementation of geographical bigotry.

Nothing new...Same old putz.

Or it could be that the power grid up there pre-dates the
electric grids anywhere else in the United States by several decades
and is in need of replacement.

It's a lot easier to build something better than the other guy
when you have his errors to learn from.

Being in second place has SOME advantages.

Nah, how about just the *second* most popular language on the
air...prosigns and Q signals. They allow us to effectively communicate
with the third most popular language...and fourth, and fifth, and so
on...

That's right, Bill. Try getting your message across via phone to that
JA station who doesn't speak a lick of English, WITHOUT speaking
Japanese. I can...and you know why. Too bad your NCI followers don't
know why. Didn't you tell them, Bill? Oh, you left that part out. No
prob, your secret's safe with me.

Your friend's license status is irrelevant. What is YOUR license
status, Sir Putzalot?

> I'm telling it like it is. "Archaic RadioTELEGRAPHY Service."

Actually, you are lying, and hoping if you repeat the lie over
and over someone will believe you.

If they are not licensed in the Amateur radio service and have no
practical experience in Amateur Radio, much the same as you, then they
might "bite" on your laughable rhetoric.

Otherwise, you're making up stuff as you go along to deceive and
antagonize.

> YOU don't really KNOW if I "bootlegged" at all, do you?

You have. Why deny it, Lennie?

> All you want to do is to selectively use my messages as an ignition
> point for a Flame War.

Oh...it's OK for >>YOU<< to do that, but anyone else doing it is
"igniting" a "flamewar"...!!!

BBBWWWHAHAHA

BTW...Did you get Mrs. Lennie to the OB/GYN to fix that fishy
smell you're always complaining of...?!?!

military service? Do you REALLY want to go there?

> You've made fun of my military service in the past. [that's in Google, by
> the way, you seem to live part of your time there...]

Jim has never made fun of ANYONE'S "military service", Lennie.

What Jim has made light of is your frequent ramblings about how
you allegedly passed millions of messages on your own, and how you
somehow think that that military service somehow pertains to Amateur
Radio.

And >>I<< take extreme exception to your pale and threadbare
attempts to link that "service" to the combat deaths of United States
Soldiers who were KIA three years before you were even
in-theater...And even then you were hundreds of miles from the hot
zones.

> You want to be honored a respected for being safely within in the USA
> borders, never serving. You want to make fun of those veterans who
> who don't love your blessed sacrament, morsemanship.

Leonard H. Anderson is again lying.

> >And it was your JOB, wasn't it?
>
> You are damn right is was MY JOB.

And it seems your JOB is all that you have to hold up, Lennie.
Kinda lonely in that small world of yours, isn't it...???

> Go Whouff-Hong yourself, sweetums. I DID have a station license
> in the PLMRS (as its called now) in a partnership in a business.

But...but...but...LENNIE...>>>THIS<<< is a newsgroup about
AMATEUR RADIO...Not PLMRS, the Army in the 1950's, or shadetree
psychiatry from Mrs. Lennie's correspondence school study guides.

> Don't give us this CRAP about "holding a station license" when you've
> stated in the past in here that ham radio is "all about OPERATING."

You do not have a station license.

You do not have an operator's license.

Except as the invited guest of a duly licensed Amateur who DOES
hold a STATION license and an appropriate OPERATOR'S license, YOU are
just a spectator.

> Bet you can't. You will weasel-word your way around it.

Like how you weasel-word your way around "I'm getting an Extra
Lite out of the box", Lennie...???

"Restructuring" is almost 3 years old now, and you've gotten no
closer to an Amateur license than hurling unfounded accusations,
profanities and threadbare recycled rhetoric in this forum.

Seems YOU have set the bar for "weasel-wording", Lennie.

Putz.

So, according to you, every single American who receives a ham license from this day forward is actually receiving a welfare handout because he or she is mind challenged? Hardly, Bruce. The only mind challenged people around here are those with views similar to yours.

First of all, the subject was you and Larry (and your attitudes about code), which I do know something about. Second, one does not need to know code itself to see the amount of code used in this country or elsewhere. Perhaps if you looked up from you code key occasionally, and stopped looking down your nose at everyone else when you do, you would see the same decline of code use and therefore recognize how useless it is as a testing requirement. Of course, to acknowledge that reality would force you to drop your false pride and I truly wonder whether you're man enough to do that (the same with Larry).

Of course, it is indeed a judgement I'm qualified to make. I certainly know as much about overall code USE in this country and elsewhere as you do. I also know just as much as you do about its NECESSITY to meet the goals and purpose of Amateur Radio. And those are the only things required to make a judgement on its value as a testing requirement.

> Incorrect. Dan and I are just speaking the truth
> based on practical experience.something you
> don't have when it comes to Morse/CW.

What experience is that, Larry? What experience do you have that makes you uniquely qualified to judge the value of a specific testing requirement? The answer is, of course, absolutely nothing - you're not uniquely qualified to make value judgements about testing requirements.

> (snip) but I'm eminently qualified to judge the value
> and currency of the Morse/CW mode based on my
> experience. (snip)

The issue isn't about the value of Morse Code itself, Larry. Instead, it's about the value of Morse Code as a testing requirement (read the subject line at the top of these messages). And you're no more "eminently qualified" to make judgements about that than any other ham radio operator. In fact, your inability to keep track of the overall subject from one message to the next makes me doubt you're even as qualified as other operators. Most people can keep up with the subject without constant reminders.

Can you can show me one law in this country that wasn't advocated by people with self-serving motives? Laws, by their very nature, tend to serve the interests of at least someone. In reality, the only reason you're pointing to this is because people are now advocating the change of a law you happen to like (the code test requirement). And, of course, you would like everyone to believe your position in all this is not at all self-serving. Of course, anyone with common sense knows that's nonsense.

> And it is my right as an American Citizen to make an

> are you afraid of?

I'm afraid of your motives in all this, Larry. I don't like the words I hear from many advocating the continuation of the code testing requirement. Those words often reek of bigotry, elitism, and discrimination against other Americans. Are you comfortable with some of the things said by those with your position? Are you comfortable with some of the things you've said (the garbage about a dumb downed America, your superiority, and so on)?

> (snip) HF access is different, and it is here that the
> Morse/CW mode offers benefits and advantages

> Therefore, the testing requirement remains current
> and valid -- forever.

Since it appears only a small minority of hams use Morse/CW on a regular or routine basis, a testing requirement obviously does not benefit "all radio amateurs." In addition, the testing requirements are not there to exclusively benefit Amateur Radio operators - they also exist to facilitate the goals and purposes of Amateur Radio. Therefore, any testing requirement must be judged within the context of each of these. The code testing requirement fails in each regard.

Well, in spite of the media hype, Isabel certainly ended up being not much of a storm. Compared to some of the previous hurricanes to hit this area, the damage was very light. Since most boaters in the area have a healthy respect for hurricanes, the Coast Guard didn't receive a single distress call. Furthermore, based on what I saw driving up the coast yesterday afternoon, it appears most boats in the area made it through the storm without any major damage (and only a few homes or commercial buildings were damaged).

Ahh, JJ, you don't do yourself any service by calling us knuckle heads!

Many of the references you get are simply wrong, others are picking up on just one of the words. Narrow the search params and you'll get about 100 hits. Some of them explaining that a 1/4 wave dipole is a mistaken term. Some that are calling a 1/4 wave ground plane a dipole, all kinds of stuff.

Webpage hits don't make something correct.

Or as Granpappy used to say "Just 'cause a cat has kittens in an oven, don't make 'em biscuits!"

I've never made a 1/4 wave dipole antenna and tried matching it with ladder line and a tuner. I suspect it won't work very well du to the huge impedence mismatch - even balanced tuners have their limits. But I'm not going to try it either. I don't have something to prove, and I've provided both official definitions and some examples worked out in a repected program.

Why don't you make one and try it out. Let us know how it works. Post your results and theory on r.r.a.antenna for thier review too.

'Scuse me but the this newsgroup is a direct spin-off from another
group (dot misc?) some number of years ago *specifically* as the place
to go for debating the code test issue. The idea was to lighten up the
increasing volume of traffic on the subject in that group when the
matter became a large and hot debate. The message is that this NG
remains true to it's founding principles and is still primarily the
code test battleground. If ya doan like it, fine, nobody has you
chained to RRAP, there are plenty of other ham NGs which are not
nearly as disgusting.

Bruce, now you let the cat out of the bag! Soon all hams will know that the whole idea of putting up these large antennas is just another ploy of PCTA's to keep those they consider inferior from getting on the air! This forces people who have enough land only to put up an antenna. More elitist snobbery!

Fact is. ANY dipole of ANY fractional length works just great!

Don't have enough space for a 1/8th wave dipole? Put up a 1/16 wave dipole. Or a 1/32 wave. In fact, dump the silly fractions, and put up a .001 wave dipole antenna.

Now for the deepest darkest little known fact of radio antennas..... They work better the SMALLER they are!!!!!

The reason for this is that by concentrating the power into a smaller space, the rf excited electrons *push* the rf out of the antenna much more energetically than in those stupid half wave antennas.

Once the rf is out of the antenna, nothing slows it dow, but in a half wave antenna, the electrons get tired pushing through all that wire.

All dipoles are 1/4 wave at some frequency. You just wouldn't want to
use them.

> Gee, your reading comprehension isn't any better than some of the others.

Well, gee.... just what were you saying? I'm trying to figure out just
what you mean. You're saying that there are lots of hits out there on
1/4 wave antennas, but you don't mean that they work well, and those of
us that say a 1/4 wave antenna isn't practical or advisable are wrong
because as long as you aren't worried aboout the antenna working or not,
you can make a dipole of any fractional length?

Thanks for proving my point, I never made ANY claims on the performance of a 1/4 wave dipole. Some said there was no such thing, I simply stated there is. So you admit the same I stated earlier in the thread, any dipole is a quarter wave at some frequency.

You have to have a mind to be mind challenged, that leaves brucie out.

4421. Boise BPL testing

Newsgroup: rec.radio.amateur.policy
Date: 2003-09-19 17:31:25 UTC
From: Paul <Paul@localhost.invalid>
Message-ID: <vmmf4qq6sqvk22@corp.supernews.com>

Sept 22 BPL scheduled for testing start in the Eagle Rd. @ McMillian area (or Eagle/Fairview not sure). This is not too far from my location. It would be nice to get some metrology on this before and after. What type of instrumentation is typically used? All I have is shortwave scanner which is pretty useless.

If you're not a ham I suggest you find some local ham operators and alert them to the threat if they aren't already aware of it -and many will not be if they haven't been very active lately.
I'm sure the local ham radio community will be interested, if not other low band VHF users.

Go to this URL..... http://www.qrz.com/i/names.html

Type in boise idaho ands you'll get a list of local hams and a club. If they don't already know about BPL I'm sure they'll be interested.

Dick

Forget about the stuff at work, how do you use it in Amateur Radio?

Yet all that message traffic was sent w/o touching a Morse key.

Part 97 sez Morse Code at 5WPM, not Farnsworth Code at 13-15WPM.

So does it really matter what a regulation sez?

Steve, not my fault that Ron said it, and I liked Ron. But his quote applied in your declaration that amateur radio has not improved since 1984.

That is not fact.

Hmmm.. well I *did* graduate within a fraction of a point of the top score in the class, though that score wan't mine. It went to a fella who had already completed over half of a college EE program. Instructors do like to see their students do well. If that makes me a "synchophant", whatever you think that is, guess all I can do is agree.

But not by Lennie! The operating wasn't done at the transmitter site. He sat and watched. Just like he -and you- are doing here.

the
> EM package.

Here's three specific reasons why EMs don't want code

1. It requires a specific skill set that even when code was a higher speed
requirement
didn't include ALL hams.
2. It doesn't allow for non hams to use the amateur equipment themselves
with
having the licensed ham simply in the room as control op.
3. Only the decoding ham can understand what is being sent while others
standing by
understand none of what is being heard.

> Not only is our equipment capable of Morse, but we have CW
> capable operators for each. We've used it in the past and I strongly
> suspect that will do so in the future as well.

Most emergency operations don't even need or use HF.
All of yesterday's activity for Hurricane Isabel was VHF/UHF
for local and county operations.

Cheers,
Bill K2UNK

No, why should it? I have ALWAYS said the code was a
separate issue from writtens. I'm not opposed to revisiting
the writtens, but there's no need to wait for that before ending all
code testing.

It addresses the fact that one can learn a subset of theory
because it isn't tested separately from rule, regs, etc.
Bottom line, if he/you want to petition to end theory
requirements then you are free to do so.

> >> When I first started out in ham radio, all I wanted to do was join the

> Apply that logic to the code test!

Agreed...and that is why we are following the LEGAL process
to get it changed...or are you saying we shouldn't be allowed
to do that because "once a rule, always a rule?"

> >.if you want it changed, petition the FCC.
>
> W5YI's working on it - you watch.

Who knows...as of now, there's no petition from W5YI.
There's a petition from NCVEC which includes W5YI...but
not anything from W5YI separately.

Cheers,
Bill K2UNK

Hello Greg and welcome aboard ..you have entered an endeavor which is a cross section of the population as a whole. This move will give you plenty of stories to chuckle about in the years to come, some frustration and increased knowledge not only about radio but of human nature. Do not rate amateur radio or compare in any way to what you read on this or other newsgroups. Just enjoy have fun ...and take people's remarks at face value. You will find the sprit that ham radio has rises above all of this.

God Bless 73 Tom KI3R Belle Vernon Pa

OK, that being the case, the few actual state laws I know about don't
question transmit, but rather only make it illegal
to be able to listen ... usually only in a vehicle...except (I think)
in either FL or KY.

That is exactly how we changed the NJ law. Today, anyone can
have a scanner anywhere in NJ (home, car, etc) and unless they are
using the scanner in connection with illegal criminal activity,
there's no violation.

That is a legitimate law
> enforcement objective, and does not involve the law enforcement

Actually, most of those laws make no reference to "intent."
They simply prohibit any/all reception, usually from a motor vehicle.

Why bother ? I just used my 20 meter dipole, coax fed with 50 ohm cable on
7.030. The SWR was off the scale.

I then hit the tune button on my FT-1000mp and that piece of junk wouldn't
tune it. So I called CQ for a couple of hours. No replies.

I then called my buddy across town to fire up and give me a listen. I was
S1 and almost in the noise.

So, for an experiment, knowing it was just a lark because the Texas Twit
said so, I hooked up my 40 meter half wave, center fed with 50 ohm coax.
My signal was now 30 db over S9.

Can you get the Texas Twit to explain this for me please.

It appears to me that the reason 13wpm and higher works, according to the reference, is that you CAN'T successfully cram to pass the higher speeds. You've got to have those neural connections solidly in place. However for 10wpm and down you can cram and pass the tests.

Regardless, there is definitely a point at which a person won't forget even if they believe they have done so (your experience being a case in point).

To me, this is the level that Extras should reach, i.e. a level that they won't forget.

How much land will be used to build enough turbines to power Seattle and the
surrounding suburbs? And the other side of Puget Sound doesn't have "plenty
of wind". It's higher than Seattle but still much lower than many other
areas of the country.

Record before and after noise on received signals. Make a log of it.
Exact 'S-meter' readings are not necessary.

You will see a major degredation of received signals.

It's easy if one puts in the time to learn. The discipline comes in allocating the time and using it correctly. If one stops prematurely, they fail. If one uses the time ineffectively, they fail.

All one is doing in "learning code" is training a reflex. This is very easy but it just takes time.

> you;d know that, wouldn't you?

Uhhh, DICK, you should know that weather data can be passed via many
modes, and that satellite imagery is referred to as wefax or wxsat.

Typically, what is called "DATA" is RTTY.

But all that is old technology. Today, we get our weather via
wideband, though you're free to play with UKMO and NAM transmissions.

>
> The difference is, I know why. You obviously don't.

Couldn't be much of a difference since you obviously don't know why.
And I know why you don't. You're simply ignorant about weather comms.
Stick to things you know, such as CW and more CW. When you're done
talking about CW, you could switch to Morse so you don't sound like a
broken record.

And FWIW, radar image intensity bulletins used to be transmitted via
tty, and the receiver had to plot it on a predetermined overlay for
that particular radar station. So the concept is there for satellite
data transmission, but was never implemented. So go and create a
satellite overlay grid, then encode satellite IR temps (if you can),
and get cracking on Robert's idea.

See, you CAN use CW to send useful information rather than just ARRL numbergrams.

Don't sweat it. The hams that you will meet in person in your local
community, local club, and on the air both locally and long range are a
pretty good bunch.

Somehow the internet brings out the worst of people in discussions. Perhaps
because they are insulated from direct contact with each other by the
internet. Who knows?

Anyway, welcome to ham radio. I think you will find some of the other
internet sites and news groups more helpful than this one. Any group with
"policy" in it's name is guaranteed to be an argumentative bunch.

There are many of us who do not look down on Technicians or consider them lowly. In the club to which I belong, our most expert satellite operator is a Technician. Everyone respects his knowledge in this area. Another Technician was our expert on VHF SSB including propagation, antennas, etc. Although now a General, he was well respected when he was still a Technician.

Unfortunately, there are way too many people who get their licenses and become strictly "repeater creatures". Those who combine this with being disrepectful of experienced hams tend to rub people the wrong way. As in

anything else, we tend to be unduly affected by the few bad apples and forget that there are a lot of good people working at their personal development.

If you contact the VE team ahead of time, you have the right to insist that they obtain and administer the test to you with both the word speed and the letter speed set to 5wpm. Tell you what though, even counting dots and dashes, letters at that slow speed are painful to decipher. Plus there is no time between letters for your brain to process the letter. Unless a person actually counts the dots and dashes, it's much easier to fail when the Morse test is set at word and letter speed of 5wpm than when the Morse test is set with the word speed at 5wpm and the character speed at 13wpm. At a character speed of 5wpm, you can't hear the letter as a letter and you can't react to the sound on a reflex basis.

Dang,

I'm glad you guys didn't tell that 1100 foot Windom I had up in the 60s. I probably wouldn't have been able to get out of the state, much less work Washington DC from Rochester, NY at 1:00 PM (in the afternoon) on 160! Plus working some CW nets in the South with the Johnson Ranger in *standby* (not tune).
LOL

73 from Rochester, NY

>

Yes it should address writtens because by eliminating the code test without addressing the writtens, you are reducing the overall level of knowledge required to earn the various levels of ham licenses. Until the replacement exams are ready, the old exams, including the code should remain intact.

Personally if the code is dropped, I would like to see the exams restructured as follows:

A) Regulations element: One must pass this before being allowed to take any of the other elements.
A lengthy and separate exam covering the FCC rules and regulations in depth. Based on what I hear on the air and the statements on the internet from any hams, there's a real problem in this area. This one should require at least a score of 85% to pass.

B) Technician element:
Rewritten to move the regulations questions to A). Additional technical material and operating procedures material to keep the test pool about the same size.

C) General element:
Rewritten to move the regulations questions to A). Additional technical material, operating procedures, and basic VE requirements material to keep the test pool about the same size.

D) Extra element
Rewritten to move the regulations questions to A). Additional technical material, operating procedures, and extensive VE requirements material to keep the test pool about the same size.

I'd really like to see a rules test as a stand alone test that one must pass before even taking any of the other elements.

I still get tickled to death over a Simpson's cartoon episode where homer
and a friend are stuck in a cabin that's bound in by snow.... they find an
old morse code key and start tapping away "S-O-S, send help..".. and
the camera follows the telegraph wire all the way in town, to a local
museum, to a samuel morse exhibit where the line ends and that's
where you hear the code being tapped out.

nobody is standing nearby to even see it.

funny, I missed the part of his post where he CLAIMED that.

I believe his point was that a weather fax is a very modern
use of the radio spectrum, and goes a long way to advancing
the art of radio as WELL as it's usefullness.

CW isn't the former, and only the old "I had to do it" die hards
find the latter to be true.

> > Well, at least you finally admit that it's "I had to do it, you

>
> The scary bit is if you keep applying logic to this argument, it
> just keeps getting wierder.

no, you just keep getting angrier because the modern-world hams
in here and elsewhere refute your (non)logic and continue to work
toward eliminating CW testing when there are other radio related
fields and issues better suited to being tested due to thier modern
day applications.

One of 'em rebutted the "I had to do it, so
> should you" argument by basically saying, uhm..."I had to do it, so should
> you."
>

and it was a failed rebuttle, due to the fact that it was illogical. Think
of it
philosphically.... what if EVERY field of endeavor that required testing
for profeciency failed to modernize, and simply keep the oldest, first
testing method on record? there would be modern day problems
and enigmas that the person may not be prepared for, though the
testing requirements showed him to be ready.....

i'm also an aviation student, learning to fly to get my pilot's license.
Now, imagine if only the first, oldest known information and testing
was used, back right after the wright brothers flew for the first time,
and I then climbed into a twin-engine jet and said, "okay, ready
to go to 20,000 feet!"

it is just too easy to beat you guys.

I once saw lighted torch semaphore demonstrated by a Chinese Acrobatic Circus.

I think they were sending "Yankee Go Home."

Or were they just juggling?

great! then those who want to use CW should allocate the time and use
it correctly to learn the discipline of CW.

Those who have no use for it and don't plan in it, shouldn't have it shoved
down thier throats.

4471. Radio Amateurs of Canada - Morse Code Survey Results Published

Newsgroup: rec.radio.amateur.policy
Date: 2003-09-20 01:13:41 UTC
From: Leo <nomail@nope.org>
Message-ID: <e57nmvs00r5nl9jjdgcdmdq42s8f28i0nf@4ax.com>
Source record: 77885

In response to the WRC 03 decision on Morse Code, Industry Canada asked the Radio Amateurs of Canada (RAC, our ARRL equivalent) to advise as to what Canadian amateurs want to do with respect to the Morse testing requirement.

RAC set up an online survey on their website for the month of August, and invited all Canadian amateurs (both members of RAC and non-members alike) to voice their opinions. The results have been tabulated and published, and has been presented to the RAC Board of Directors for discussion with IC in the near future. The following web site has the details:

http://www.rac.ca/news/mresults.htm

Basically, the majority (overall 66%, or two out of three respondents) is in favour of dropping the Morse requirement for access to the HF bands. Similarly, 69% are in favour of modifying the Basic exam, presumably to increase its relevance to operating on HF. For those of you south of the border, the numbers are quite interesting, and may give you some insight into the statistics you might find within the US Amateur community. I was surprised, for example, at the percentage of Advanced with Morse (our 'Extra') licence holders who are in favour of dropping it - 52% - and we're the guys who 'paid the dues' and made it to the top rung of both theoretical and Morse capability!

The same process was used to review reducing the Morse requirement from 13 WPM to 5 WPM a couple of years ago - Industry Canada went along with the recommendation the Amateur community (via RAC) - it is anticipated that they will in all likelyhood do so again, as this is obviously the will of the majority. Not all of us, not by a long shot - but clearly, the majority!

In short, it certainly looks like it is only a matter of time before Canada drops the Morse requirement for HF. But we may have an opportunity to raise the skill level of those who enter Amateur Radio through more relevant (and maybe more rigorous) testing.

To close with a quote from a famous Canadian, Marshall McLuhan (the media visionary and professor who conceptualized the "Global Village" and the impact of high-speed communications way back in the '60s):

"The past went that-a-way. When faced with a totally new situation, we tend always to attach ourselves to the objects, to the flavor of the most recent past. We look at the present through a rear view mirror. We march backwards into the future."

We sure do.

73, Leo

Well if you raise the skill level, it will just keep people out of Ham radio. That has been one of the reasons cited for getting rid of the code test. It won't do just to increase the entrance requirements, which will partially defeat the purpose.

Perhaps being knowledgeable about RF matters is also in the past, Leo. A person can pick up a rig, a linear and an antenna without knowing anything about RF electronics. He/she can pay someone to put it up, and can be talking in no time. Given this, why should there be any requirements at all?

(suggested antenna is a 1/4 wave dipole) 8^)

Wow! You've stated that you've operated from countries where you were
the only active amateur.

Somehow that was significant then, but 120 or 1,500 native amateurs
aren't?

There's that famous Heil smugness again.

Good points, Mike - my comments are below:

> Well if you raise the skill level, it will just keep people out of Ham
>radio. That has been one of the reasons cited for getting rid of the
>code test. It won't do just to increase the entrance requirements, which
>will partially defeat the purpose.

There are advantages to having more people in Amateur Radio - not the least of which are more voices to oppose things like BPL. And, less unused bandwidth, which could be taken away and reassigned to commercial iterests if we don't utilize it.

On the other hand, bringing in large numbers of less-skilled operators defeats the purpose of Amateur Radio, which I recall was to develop a pool of skilled radio operators.

The concept of modifying the test is a middle ground - by adding questions on actual practical HF operation, for example, we would ensure that new amateurs could go and set up and operate their station without undue interference to others. A good thing, I believe, and one that would raise the level of 'professionalism' amongst the novice Amateur operators.

>Perhaps being knowledgeable about RF matters is also in the past, Leo. A
>person can pick up a rig, a linear and an antenna without knowing
>anything about RF electronics. He/she can pay someone to put it up, and
>can be talking in no time. Given this, why should there be any
>requirements at all?

There are legions of operators out there today who operate 'point and shoot' equipment - the level of technical knowledge and ability has most certainly deteriorated as a result. Not many construct their own equipment any more, not even antennas. But, the price of admission to the Amateur ranks is testing of theoretical knowledge - this keeps those who are unwilling of making the commitment from oprating (legally) on our frequencies. As it always has been, and should be. Without this, we would become a variant of CB.

>(suggested antenna is a 1/4 wave dipole) 8^)

...for some of the incognoscenti on the air, I'd recommend a 1/4 wave stub :)

> issues.

You can thank R. Hollingsworth for all of the above goings on.

Ham radio used to have 3 or 4 frequencies where all the
kooks would migrate to, day and night. It used to be that
14.313 or 14.300 were the "daytime kook channels" and
3894.5 or 3.901 were the "nightime kook channels".
Everywhere else was clean and clear.

Look at this this way: Every part of town
needs it's 'low rent district'. A place where
the lower strata of society can live, reproduce
kill off and amuse itself, apart from, and more importantly
out of sight/mind from the rest of polite society.

This is EXACTLY what PURPOSE the above frequencies
served, and it did it's function quite well. When R.H. started
to apply the "heat", all the crazies migrated away from ham
radio to Internet Newsgroups....and now we are where we
are as a result of the same.

>I see "newbies" come to these boards for help, and get cut
> down by inconsiderate jerks who just feel like making people feel
> stupid. How many hams didn't start out with a lower-level license?

> are generally just a wonderful bunch, these groups have really changed
> my view of the amateur radio community. I don't doubt that even this
> thread will end in a violent exchange of profanities and become just
> another flame war.

This is the unfortunate result of the foregoing circumstances
when all the kooks migrated from 75 and 20 Meters.
Best to just ignore them, what few of them are left that is.
(many of the "all time great goofballs" of the 14.313/14.300
Maritime Net wars are now SK, or off of ham radio completely
and all your left with is the latecommerswho don't have a clue
as to the history if the same which goes back to 1978 and
peaked around 1989 -92)

Leo,

For more gain than that 1/4 wave stub, consider a 1 foot dish for 160 meters. With a 1/1000 wavelength dipole at the focal point, you should be able to get some interesting results.

Yeah. After six months, everything was peachy in Germany and in Japan.
That is why there were so many tourists going there.

Oh wait -- that's bullshit.

And when you say "we", as in "did we have this amount of trouble", do
you really mean "we", or are you referring to the generation who gave
you everything that you now disparage?

More people die every week in car crashes in the US, than the entire US
death toll in Iraq since the war started.

How come no one is bitching about car crashes? 100 US citizens per day
die in automobile accidents. But the news says "another US soldier was
killed in Iraq..."

Both of those stories are horrible, awful, but put it into perspective.
On average, one child per day dies from choking on crayons according
to the CDC.

Nah, 'snot about wave mechanics, has to do with thermodynamics. My take is that the FCC figgers that if they license enough of these 21st century quarter-wave dipole adherents one of 'em just might finally stumble onto the way of *decreasing* Entropy. Something about not needing to drill for more oyl in Alaska and getting Dubya's energy bill thru the house . . .

Well, you certainly had a nice "ground connection" with all that water
ABOVE you. :-)

At RCA EASD in Van Nuys, CA, I shared an office cubicle with John
Kaiser. John served 4 years in the Pacific during WW2. One lunch time
I asked him about submarine life, being very unfamiliar with the Navy or
that particular part of the USN. Since we were both in electronics
engineering, I asked him if the lights really went out during depth bomb
attacks, as I'd seen it in the movies.

John considered this question for at least a whole minute. He answered
(approximately) "I really don't know...when GQ was sounded I went to my
station (the radio cubicle), shut my eyes, grabbed the receiver handles,
and prayed a lot...never did notice if the lights dimmed or anything..."

Ooooo! Spent your whole tour of Army duty at Monmouth, did you?

You had fun splicing mag tape? :-)

That's STUDIO BROADCASTING duties, NOT communications.

>You see, instead of sending me to an obscure, remote MINOR outpost about as
far
>away as it's possible to be sent, when I finished electronics training, the
>Signal School kept me there as permanent party, to work as a broadcast
>engineer at the educational TV station ran by the school.

My Signal School training was 7 months total at Fort Monmouth in 1952 for
microwave radio relay MOS. We didn't DICK around with AFRS things,
but spent all the Monmouth time in learning to operate and maintain radio
relay equipment for communications.

The primary communications facility for an Area Command is hardly "minor,"
numbbrain. Took half a battalion to handle the quarter-million messages
per month relayed through ADA in the mid-1950s.

ADA was the callsign of the Far East Command Headquarters in Tokyo.

ADA is still the callsign and now belongs to USARPAC, the United States
Army Pacific, based at Fort Shafter, Hawaii.

>out there in the JA boondocks with nothing to do but listen to the
transformers
>hum and wait for another overload. And I hear those BC610's didn't overload
all
>that often, either. Tsk, tsk.

ADA didn't have "BC-610s," ignorant one. BC-339 1 KW oldies, BC-340 10 KW
oldies, Press Wireless PW-15s, Western Electric LD-T2 4 KW PEP SSBs,
AN/FRC-22 40 KW (Linear mode) used as amplifiers for the LD-T2, a Collins
Autotune 1 KW model, a Wilcox Electric 1 KW AM transmitter. Frequency
synthesizers had yet to develop so all FSK transmitters used O-5 exciters
requiring direct crystal control. ADA had about 3 dozen O-5s on racks
behind the central control console and QSYs required changing quartz
crystals kept in a heated cabinet. Each shift in a 24 hour period averaged

about 11 QSYs each. Every QSY had frequency checked prior to resumption of traffic by a General Radio Frequency Meter at the receiver site at Camp Owada (roughly 30 miles away), reporting Mark and Space frequencies to the order-wire TTY loop linking transmitters, control at Chuo Kogyo, and receiver frequency standards. The average QSY was 2 minutes from QSY order issued by control until frequency standards reported (on TTY) that frequencies were within limits. SSB transmitters were servo-tuned to 10 preset frequencies and a QSY on those took 30 seconds; frequency standards would double-check the pilot carrier frequency but those never varied. All of the O-5s required separate manual setting of Mark and Space; a Fox Test mechanical TTY player was used for Mark/Space setting (control had 3 at their disposal for that).

BC-610s were in the AN/GRC-26 vans, self-contained stations fitted with TTYs and exciters for FSK RTTY. My battalion was a caretaker for a half-dozen of those to be used for emergency communications netting. For emergency linking on landline cable going out, ADA transmitters had 7 AN/TRC-8 and 6 AN/TRC-1 UHF-VHF radio relay terminals at the old site on Tsukishima. At the new transmitter site ADA had four 24-voice-channel GE microwave radio relay terminals (two running, two as hot spares) at 1.8 GHz band center, full duplex, 10 foot diameter Andrew parabolic reflector antennas on a 200 foot tower, pressurized 1 5/8" solid coaxial feed.

The billet for C Company (transmitters), 8235th Army Unit, Army Central Command Japan, was at Hardy Barracks in Tokyo's Roppongi district. Tokyo, a major metropolitan area, is hardly in the "backwoods" of anyplace. Hardy Barracks still exists as a US facility today despite almost total pull-out of US installations since the 1950s...a two-page article on Hardy Barracks of the 1950s was done in the Pacific Stars & Stripes last year in November, staffer Rick Chernitzer interviewing me for the entire article (photos used were mine also). Hardy Barracks is less than a mile from the Diet (Japanese Congress).

In 1955 ADA handled about 220 thousand TTY messages a month to/from Army units, plus additional circuits for USAF and USN. Two Facsimile terminals were at the control center. Control's TTY "room" was the entire second story of a converted warehouse holding over 200 various TTY terminals, most being rack-sized units having both transmitting distributor and receiving punch (all tapes were punched chadless to allow over-printing to read the address preambles). Control at Chuo Kogyo (the name of the former Tokyo civilian company) originated very few messages, serving to relay all traffic by the "torn tape" method with operators reading
the address preambles and hand-carrying tapes to the proper destination.

Radio circuits were to Saigon (then in "French Indochina"), Manila, Okinawa, Pusan (Korea), Seoul (Korea), Anchorage, Seattle, Hawaii, San Francisco on a 24/7 basis with other radio circuits as needed such as the Far East Commander's aircraft. Okinawa, Seattle, Hawaii, and San Francisco had SSB in addition to FSK RTTY. Each SSB circuit had two voice channels plus about 8 TTY channels with duplicated Mark

Space tones to avoid selective fading effects.

The receiver site at Camp Owada was truly "out in the boondocks" and shared between Army and USAF. It was a radio-quiet environment and the antenna field was considered the largest in the world in the mid-1950s. "Receivers" had antenna multicouplers to allow space-diversity auto-switching between a pair of widely-separated rhombics. With tone pairing on SSB to overcome selective fading effects, the combined space and frequency diversity allowed an excellent low error rate at receivers.

USAF was given responsibility for operating the Army HF primary communications in 1962 and they continued until the Central Honshu HF comm facility was disbanded in 1978. That included the 9 microwave terminals I was responsible for at Chuo Kogyo control as supervisor.

HF communications capability still exists in Japan at Camp Zama (near Yokohama), maintained as a secondary comm means by the 78th Signal Battalion under the command of the 516th Signal Brigade at Fort Shafter. US military primary communications is now handled by the DSN (Digital Switched Network) using fiber-optic cable and satellite relay. The DSN offers both telephony and Internet-like computer-modem communications with the added capability of being encrypted.

>What a chutz-putz!

Too bad you didn't get into the Big Leagues of REAL communications, old-timer. You wouldn't have to snarl and hurl epithets as an amateur after fussing around with AFRS toys.

Leonard H. Anderson
ex-RA16408336, US Army Signal Corps

Why would you have a problem because radio amateurs use morse. You
aren't involved.

> Morse doesn't work
> well enough for communications...

Works fine, Len. I can see where you'd have a problem if you aren't
able to read the stuff though.

> doesn't really "get through when
> nothing else will"

I've attmpting copying a weak 6m SSB station during an auroral event
with little success. That same station was pretty easily copied when he
switched to morse. It has also been my experience that weak Europeans
using CW can be copied on 160m when their SSB signals can't be read.
How does that compare with your experience?

and isn't a "universal language."

How would you know?

> I've been far more INVOLVED with civilian communications than any
> early military radio. On the engineering level, not as an amateur
> hobbyist.

Did you have a point? Were you aware that the portion beginning "On
the..." isn't a sentence?

But Leonard, old chap, you aren't an AMATEUR radio op at all under the standards of any year. You aren't even qualified in "hoop jumping" as you call it. The fact is, if you are ever to grace us with your presence on the ham bands, you'll jump through whatever "hoops" the government has in place or you won't be licensed.

Nobody can now meet the requirements most of us met, Leonardo as current requirements are not as stringent.

> Jump, jump, Danny.

...and you, of course, don't seem to be able to meet even the current requirements. Don't bother jumping, Len. Just stand there on the sidelines and watch the game.

> No more "irrelevant" than your constant BULLSHIT about morsemanship.

It's not bullshit, Lennie. I can do it, and I can prove it!

> EVERYONE ELSE in radio but certain amateurs, maritime radio
> included, have dropped morse code modes. Morse doesn't work
> well enough for communications...doesn't really "get through when
> nothing else will" and isn't a "universal language."

And the above is meaningless, since you're not a qualified judge of the Morse/CW mode. End of story.

> I've been far more INVOLVED with civilian communications than any
> early military radio. On the engineering level, not as an amateur
> hobbyist.

Still meaningless, since amateur radio operators ARE hobbyists. Your experience may be relevant to commercial or military communications environments, but not to the AMATEUR radio service. I really don't know why you waste your time here.

>>In fact, as a person who does not use the Morse
>>code for any reason whatsoever, you are self-disqualified from rendering
>>any judgment on the topic whatsoever.
>
> Hey, like you are "qualified to land any human resources (personnel)
> job because of your alleged high grades" and wind up driving a BUS?

You've still never provided that exact quote, Lennie, but the fact is, bus driving pays better in these parts.

> Like you've NEVER worked any military communications in your entire
> TWENTY except a telephone on your desk?

I've used lotsa LMR radios, but I was in transportation, not Comm. As I already said thousands of times, I'm strictly an AMATEUR radio operator.

> Tell me all about your "qualifications" for judgement about anyone, big
> shot. You seem to forget all the BS you were spouting about "summa
> cum laude" and "landing any (important) job you wanted." You wound
> up DRIVING A BUS.

C'mon, Lennie. Show us the quote!

> You NEVER HAD to do military communications 24/7 anyplace so ALL
> you can use as a judgement reference is as an AMATEUR, playing
> around in a radio hobby, bragging up a storm like you were Marconi
> himself.

Yawn! And just when did I make THAT claim?

> Roll, you are RETROGRADE as an AMATEUR. All you want to do is to
> keep everyone else in amateurism DUMBED DOWN to 1930s standards
> and practices.

Which, of course, is why I've been using PSK-31 since the moment it became available to radio amateurs! However, I guess there must have been a lot of PSK-31 being used in the '30's, if you are to be believed.

> Where is that big "human resources" job you said (so many times) you
> could get?
>
> You can't even get anyone to do a PSK31 contact with yet you make all
> the 1930s noise about morse code!

I make lotsa PSK-31 contacts, Lennie -- just not with anyone on this newsgroup…well, not with any NCTA's, at least!

> Roll, despite your snide EGO in over-drive, I've not only done what I say
> I've done, but I have the references and the proof, including being
>friends with radio amateurs who can testify as to what we did.

Fine, good. I've never questioned that. However, you seem to think it is necessary to keep driving that point home over and over. Kinda makes one wonder who you're trying to convince?

> All you have after a twenty in the USAF and that alleged degree (where you
> said you could get any personnel job you wanted) is driving a BUS.

What I have, Lennie, is a job that I like, that I enjoy doing, that gives me a lot of satisfaction working with people who really need my services, and has pay and benefits way above what I could get in any entry-level HR job. Moreover, my fellow bus drivers come from all walks of life and many professional occupations, and many are fellow college graduates. So what is YOUR problem with MY job? Yes, I may have one time indulged in idle speculation that I could get a good HR job, but then, I was unfamiliar with the realities of life regarding that field -- mainly that it is dominated by women and minorities, and doesn't pay well except at

the highest levels of experience and responsibility. I chose that field to get a Bachelor's degree mainly because I wanted a degree in ANY field at all which was generally business-related, and I got a lot of transfer credit from previous college experience. Whether or not I ever work a single day in HR is now irrelevant to me -- but getting my degree exposed me to much more than the personnel management curriculum. It exposed me to arts, science, mathematics, humanities, literature, and the rest of the general college curriculum. It made me a better person, and that helps me in a job where I have to deal with physically and mentally "challenged" people on a daily basis. So go ahead, keep ridiculing me for making the effort to better myself. It only serves to prove to everyone what they already know about you.

>>You are not influencing anyone on the topic of code testing.
>
> You are beyond "influence," Larry Ego.

Pot -- Kettle -- Black. Your specialty.

> If you had all that personal "power" and "moral resolve" you brag about
> having, then you COULD have gotten a good job in personnel and worked
> your way up. You didn't. You opted OUT. Took the EASY route. No
> strain, no pain.

I addressed my personal need for a job with good pay and benefits, and adapted to reality, Lennie. I probably could have got a low-level HR job if I were willing to make an expensive relocation to a much higher cost of living area at my own expense. I chose not to. You do understand basic economics, don't you, Lennie?

> All you are is an AMATEUR at a level of the 1930s standards and
> practices in amateur radio. No more. Your BS doesn't work. All YOU
> are "qualified" in is hoop-jumping to old, old rules, and shoveling manure
> with your degree showing.

And all you're good for is making loud sucking sounds, Lennie.

Putz! (Apologies to Steve)

>> The problem wasn't the "*@#%^&! code test" at all. It was you and your
>> negative attitude toward it.
>
>Only partly true. My negative attitude I freely admit.

Alun:

Stop right there. Your negative attitude was the whole problem.

>However, I had no
>aptitude for the subject, and still don't.

Incorrect. By your own admission, you eventually did pass the code
test, which shows that you could, indeed, demonstrate some aptitude.
However, it was your negative attitude toward it which truly got in
your way.

>Who knows why I should be good
>at science and languages, and yet lousy at woodwork and CW, and yet it's
>so.

It's still all about attitude. I'll bet that if, given the time and proximity
which
would allow some personal mentoring, I could totally change your attitude,
and therefore your aptitude, toward both CW and woodworking. Whether
you realize it or not, you have that potential within you. You just don't want
to tap into it -- and that's attitude.

>Each of us has innate abilities in some things, balanced by innate
>incompetence in others, i.e everyone is unique. I feel that this has been
>ignored by the pro-code side of the debate, or rather that it is known
>damn well, but none of you will admit it!

I, for one, must disagree because I have lived on both sides of this
particular fence. From the time I originally became aware of Amateur
Radio, at age 14, until I finally became licensed at age 28, I had a very
negative attitude toward learning the Morse code, and therefore, I failed
at every attempt to do so. It wasn't until I, through more mature
judgment and some soul-searching, became aware of my negative

attitude toward the code and it's effect on my so-called "aptitude" for it, that I was able to make the change. I believe this was the value of the code testing requirement for me, since my desire to be a licensed radio amateur was stronger than my objection to learning the code. At the end of the day, I made a turnabout in my attitude toward the code, and from then on, it came quite easily for me. My experience led me to become convinced that the code testing requirement is of great value in getting prospective radio amateurs involved in this mode.

>It is possible to learn something that one is no good at in order to pass
>a test, although unlikely that practical fluency in the skill would ever
>be acheived.

Yet another example of a negative attitude. I overcame this by making a personal shift in my attitude, and deciding that I would, indeed, become a proficient CW operator. Once that change was made, CW came quite easily for me, and even became fun -- to the point where it is now one of my preferred modes to use OTA.

>It is even possible to learn something that one is both no
>good at and has no interest in, although much harder, and then the level
>of difficulty becomes crushingly hard. This is true of any skill, and
>interest is, if anything, maybe more important than ability, but any
>schoolteacher will tell you that when neither are present in even the
>snallest degree the chance of success is slim to none. So it was with me
>and Morse code. I did it eventually, with a huge amount of outside help,
>without which I would never have succeeded on my own. The reason I didn't
>succeed earlier is straightforward - I didn't get help before.

All of the above makes my point about attutude.

>So there it is. I have a negative attitude, coupled with zero aptitude,
>and have never heard any convincing argument in these last 32 years as to
>why I should have had to have done it in the first place. Sure, I've heard
>lots of lame excuses as to why there should be a CW test, but nothing even
>approaching anything beleivable.

Obviously, your negative attitude toward the code is deeply ingrained, but it can still be overcome. However, in the absence of any requirement for you to overcome it, you will not likely change.

>No doubt CW is very useful, but I am no
>bloody good at it, and I prefer to actually _talk_ on the radio in the
>first place. That's all. No PSK31, no SSTV, no RTTY, etc. Boring and
>limited to some, but if you prefer CW or PSK, or WHY, then you're welcome
>to use them.

I, for one, found just "talking" on the radio to be quite unfulfilling. Each QSO became just more of the same old tedious re-hashing of the same old boring topics -- mainly the weather, the relative health of the operator on the other end, station equipment, etc. I always tried to make it more interesting by raising questions about unrealted topics, but it always went the same way. This, followed by the tendency of phone operators to

make lengthy monologues which made it almost impossible to even remember what they were talking about, came to convince me that phone is generally a waste of time. I now use it only in contests and local VHF/FM contacts, mainly from my car.

I'd say that your experience is pretty typical of most NCTA's. Your main problem is that nothing happened to change your attitude. Now, in the future, with the lack of a code testing requirement, there will no longer be anything there to create the kind of epiphany which I experienced in learning the code. This will truly be a great loss to the amateur radio community.

>(the same with Larry).

Dwight:

You just locked, loaded, took careful aim, and shot yourself in the foot!
If you had ANY experience with Morse/CW at all, you'd realize that the
mode which is in "decline" lately on HF is SSB -- due to poor operating
conditions. The CW segments continue to jump with activity. You
are hopelessly out of the loop due to your own operational inexperience.

I'm gonna give you some free advice here, Dwight. You're getting almost
Kim-like in your shrill but specious arguments. You are truly not
equipped for this debate whatsoever, and are making a bigger fool of
yourself with each and every posting. You're out of your depth when
discussing code testing, so I would suggest, for the sake of your own
credibility, that you chose a topic you know something about.

> Of course, it is indeed a judgement I'm qualified to make. I certainly
>know as much about overall code USE in this country and elsewhere as you do.

Dwight:

How many CW contacts have you made in your ham "career?" I'm into the multiple thousands. If you have less than 500, then you're not even close to being qualified to render a judgment against code testing.

>I also know just as much as you do about its NECESSITY to meet the goals and
>purpose of Amateur Radio.

Except, of course, when it comes to the issue of retaining a testing requirement for a valuable basic communications skill. However, this type of selectivity is certainly nothing new in the human condition.

>And those are the only things required to make a
>judgement on its value as a testing requirement.

Incorrect, but the above is probably the main reason why we're losing our culture here in the United States.

>> Incorrect. Dan and I are just speaking the truth
>> based on practical experience.something you
>> don't have when it comes to Morse/CW.

> What experience is that, Larry? What experience do you have that makes you
>uniquely qualified to judge the value of a specific testing requirement?

Twenty-two plus years of OTA HF experience as a radio amateur, which has been about 80 percent CW, 19 percent RTTY and other digital modes, and 1 percent phone. What's your breakdown?

>The
>answer is, of course, absolutely nothing - you're not uniquely qualified to

>make value judgements about testing requirements.

I can see why you'd think that way, Dwight, especially when my own objective evaluation of those requirements does not advance your own agenda to gain full HF privileges without any necessity to make the effort to learn the valuable communications skill of Morse code.

>> (snip) but I'm eminently qualified to judge the value
>> and currency of the Morse/CW mode based on my
>> experience. (snip)

> The issue isn't about the value of Morse Code itself, Larry. Instead, it's
>about the value of Morse Code as a testing requirement (read the subject
>line at the top of these messages).

I have consistently directed my comments toward the testing requirement as opposed to the mode itself. The confusion there is primarily an NCTA problem.

>And you're no more "eminently qualified"
>to make judgements about that than any other ham radio operator.

Unless, of course, that "other" ham radio operator has OTA HF/CW experience at least equal to my own. And, unfortunately for the NCTA, most hams who do have CW experience similar to mine are usually PCTA's.

>In fact,
>your inability to keep track of the overall subject from one message to the
>next makes me doubt you're even as qualified as other operators. Most people
>can keep up with the subject without constant reminders.

Now you're grasping at straws, Dwight. Trying to find some way to discredit me any way you can. This is always the indication that you've run out of logical, reasonable arguments. I'll give you partial credit for not having resorted to name calling -- yet.

Dwight:

Which it isn't. The only outcome I desire is to preserve Morse code testing in order to preserve the continued growth in the numbers of new hams who have been exposed to training in this mode, in the interest of getting some percentage of them to get to the point where they can effectively use it OTA.

>> And it is my right as an American Citizen to make an

> I'm afraid of your motives in all this, Larry. I don't like the words I
>hear from many advocating the continuation of the code testing requirement.
>Those words often reek of bigotry, elitism, and discrimination against other
>Americans.

One of the classic NCTA whines. Us horrible old PCTA's want to keep Morse code going so that we can continue to demonstrate the dominance of the white, middle-class, American male, who represents 5% of the world's population yet consumes 25% of the planet's resources, and is responsible for racism, bigotry, famine, disease, poverty, ethnic cleansing, global warming, destruction of the environment, homophobia, halitosis,

and every other bad thing you can think of. Yawn! However, I guess that
works for you NCTA's, in the absence of any truly valid reason for the
further dumbing-down of licensing requirements in the ARS.

>Are you comfortable with some of the things said by those with
>your position? Are you comfortable with some of the things you've said (the
>garbage about a dumb downed America, your superiority, and so on)?

Don't look now, Dwight, but America *is* dumbed-down. It has been made
that way by a liberal, socialist media that continuously mocks traditional
values of morality, integrity, ingenuity and hard work, and makes it a virtue
to be dependent on government for cradle-to-grave life support. It is truly
an international conspiracy to deprive America of it's greatness.

>> (snip) HF access is different, and it is here that the
>> Morse/CW mode offers benefits and advantages
>> which can be exploited to the benefit of all radio
>> amateurs -- but only if they know how to do so.
>> Therefore, the testing requirement remains current
>> and valid -- forever.

> Since it appears only a small minority of hams use Morse/CW on a regular
>or routine basis,

And it is my desire that the ARS continues to have at least that "small number"
of CW-using hams among it's ranks. I don't think that's too much to ask.

>a testing requirement obviously does not benefit "all
>radio amateurs."

Well, it certainly doesn't benefit those hams who can't be bothered to
learn a useful communications skill. However, considering the nature of
the ARS in today's electronic communications reality, where the typical
teenager with a computer and a cell phone has truly global communications
capability in his pocket, ham radio still serves as the ultimate backup
system which can effectively employ numerous modes of communication,
including the most basic form -- Morse/CW. I don't want to see that
valuable capability become obsolete merely because of the indifference
of those who don't wish to make the effort to learn the Morse code.

>In addition, the testing requirements are not there to
>exclusively benefit Amateur Radio operators - they also exist to facilitate
>the goals and purposes of Amateur Radio.

And it is my belief that unless we preserve code testing, those goals cannot
be fully achieved.

>Therefore, any testing requirement
>must be judged within the context of each of these. The code testing
>requirement fails in each regard.

Just the opposite is true. However, as previously stated, you are not
qualified to make any judgment against the code testing requirement,
since you have not gained practical operational experience in this mode.

You have not had that mode's unique benefits and advantages proved to you over and over again through years of daily OTA use. I have. And I didn't go into ham radio as a CW "lover" by any means -- in fact, I was a dedicated NCTA at the time. I came across to the other side due to my own experience with Morse/CW, and thus became a True Believer. Moreover, while I now consider myself to be primarily a digital mode operator in my OTA experience, I still continue to be convinced of the value of CW when I use that mode after using PSK-31, RTTY, or any other digital mode. It's all good, and I believe that we hams need all of these resources at our fingertips. However, the only way we'll "have" CW is to know the code, and that's the rub for you NCTA's.

I'm reasonably sure you'll ultimately get your way, since that's the direction this country is going in general -- down the tubes.

I just think you are one of the usual morseman BS artists in here.

>It must really frost you that I've been
>successful at everything I've ever done -- including Emergency Management
>(apparently you've failed at many things along the way)

You've been "successful at everything you've done?"

What have you "done" other than acquiring titles?

What have I "failed at many times along the way?"

I started out working as an industrial illustrator, then switched to
electronics engineering in 1958. Did engineering full time until
retirement. I have a nice income, a wonderful wife (who was my steady
girl friend in high school), a fully-paid-for house in Southern California
and another, also fully-paid-for house in Washington state (that one on
5 acres).

I've never tried to "get" any amateur radio license. Had a commercial
radio license since 1956. Having done 3 years of Big Time long-distance
24/7 HF communications in the military, I have no interest in "working DX
from my home station."

>If you doubt my
>credentials, feel free to read the article on my web site that was done by
>the local paper when I was appointed as director for EM.

I'm sure you can get all sorts of "credentials." :-)

But, what have you DONE besides acquire credentials?

>Then verify the
>sources. As for you -- since you *still* can't reply without being the
>insulting obnoxious petty bore you've always been, its back to the killfile.

So, you think it is "okay" to be the insulting obnoxious petty bore
who has an amateur license but you object to all of us who don't
have an amateur license?

Sure looks that way to me and many others, Ah-nold.

>To be honest, I'd much rather exchange views with Bill Sohl -- at least he
>makes cogent debatable arguments from his side of the isle.

When I see "cogent debate" from yourself, sans the snarly sarcasm of
the codified royal classes attitude from yourself, I'll be more than happy
to do REAL debate with you, Ah-nold.

You can't do it. Have never done it.

Surprise us with a first for yourself and lay off the "morsemen are
superior beings" bullshit and you can get some "cogent debate."

Happy credentialism.

Must have been a new policy at Fort Monmouth to rate "students" by
"points."

Those of us in Basic Radar and Microwave Radio Relay MOS classes
got a very binary "score:" Pass or Fail. [Fail score was off to the
infantry or other wonderful cannon fodder duties]

That was in 1952 when the Korean War was still on.

Must have gotten very quiet after 1953 and the Truce started.

DICK, I've already TOLD you what station ADA did. Try to remember it.

In 1953 through 1956, ADA *never* used any on-off keying codings.

ADA never had or used any "BC-610s" either...too low a power output
for reliable 24/7 trans-Pacific use.

ADA relayed 220 thousand TTY messages a month in 1955.

TTY, not morse. A half century ago.

Try not to equate the military or the rest of the world with the technical
competence of the Misery state police.

So be it then. This issue is about
a CW test requirement anyway...not whether you want to use
CW in your local area for emergency comms.

Gee, when the states stopped requiring manual transmission knowledge
and/or use of hand signals while driving, what'd they replace
those elements with to keep the driving test at the same level of knowledge?

The point is that licensing should be about rational requirement
consistent with license privileges. It has NOTHING to do with maintaining
any set level of difficulty...as if that can even be measured in some
way.

> Personally if the code is dropped, I would like to see the exams

Not a bad approach... but not sure 85% should be expected passing
rate for A. In any case, such a change in approach would involve
considerable comment and discussion which should NOT stop
the immediate removal of Element 1 (code).

I guess you missed the entire point that WEFAX isn't in any circumstance handled by Morse code. That is reserved for text communications or coded letter groups.

> 73, Brian

Piffle. THAT is an obsolete use of Morse code.

Using it to pass message traffic when radio conditons are such that it works well but other available modes won't is another matter, as you know.

Charles:

I'm sure you've been told this before, but here goes...

This newsgroup exists specifically for the code/no-code debate, and
other amateur radio policy issues. It's purpose is to isolate this
particularly contentious debate and permit other newsgroups to be
able to address more specific technical and operational issues.
Your whining about the nature of this newsgroup is, in fact, quite
off-topic, and a violation of Usenet policy. If you cannot grasp the
nature of this newsgroup and abide with Usenet policy by accepting
rrap for what it was specifically intended to be, then I suggest your
time would be better spent elsewhere.

Not true. There is an incredible amount of digital "traffic" that is
actually
voice. Voice over IP, Voice over ATM, traditional PCM encoded voice, etc.
Once digitized, voice traffic isn't any different than any other digital
information (i.e. data).

Additionally, the term "traffic" is generic as to type/content and
does include any/all types of information transfer...voice, text, video,
image, etc.

Cheers,
Bill K2UNK

Yes, we all know how this discussion was "run off" from another place, where
the hams found it to be pointless, ignorant and disgusting... Just like it
is here.

I like hearing the story about the code/no-code discussion was chased off to
a lesser venue, and believe it is 'way past time for this to happen again.

> Your whining about the nature of this newsgroup is, in fact, quite
> off-topic, and a violation of Usenet policy.

Gee, that's tough....

>If you cannot grasp the
> nature of this newsgroup and abide with Usenet policy by accepting

I'm sure it would, but since I don't have anything better to do, I'll point
out how silly and counterproductive the behavior on this newsgroup is, from

time to time.

Everybody already knows how ignorant the code/no-code debate is, but I'll go ahead and point that out every now and then, as well.

Anybody else want to join NCNCI ? (No Code/No-Code International, of course!)

Charles Brabham, N5PVL

AH! we've finally gotten to the personal character attacks. You must have already conceded defeat. That's the only thing one can conclude when the ideas and facts stop flowing and the insults start flying.

Don't flatter yourself, Clint. The comment was directed to Len. You, OTOH, haven't responded to the comment except for making some superfluous remark about defeat where there is none. In doing so, you make my point for me.

Please note that my reply, in this case, was not an argument either for or against keeping the CW testing. It was simply a comment on learning. Therefore your response is irrelevant to this particular comment. If you wish to debate effectively, responses need to be related to the statement.

Hey, Arnie! If "personal character attacks are an admission of defeat,
why don't you ask Clint about calling us N***'s? He must really be
admitting defeat if he both calls us that *and* invokes Godwin's law.

You still need to work on reading comprehension, Bruce. By that response, you either never intend to receive a ham license again or are admitting to being mind challenged. Read it again and think about it.

Yup. Keep in mind I'm playing devil's advocate a bit here Leo - but with a bite. The arguments that can be used against testing are good ones.

I'm a firm believer in a well educated ARS. I think we have to work on and decide just how much rf savvy the average ham has. I like to be surrounded by people who are both knowledgeable and those who are eager to learn. Just like on my hockey team, where I recruit both decent athletes and those who are working hard at becoming good hockey players.

I like being around savvy and hard working people. I think it improves the situation.

> The concept of modifying the test is a middle ground - by adding

Yes indeed. I really hope that the new people coming into the ARS are accepting of the occasional reminder of being out-of-band, or splatter or all the other things that are often deficient in newcomers. I thank goodness that there were people to correct me when I needed it.

>>Perhaps being knowledgeable about RF matters is also in the past, Leo. A

> Without this, we would become a variant of CB.

Yup, and that is my major point, even if I'm arguing it as devils advocate. We are at a crossroads now. The removal of Morse Code if it happens (and no doubt in my mind it will) is one of the major changes in amateur radio to come along in a while. I want a savvy ARS, but if we don't watch it, we can end up with relative anarchy.

Good posting Leo.

EXATCLY. The problem is that the PCTA crowd refuses to
split the two issues; they are attempting to force it to a "ALL
CW OR NOTHING" debate, and it's not so.

I use cw; my first several QSL cards were from CW contacts.
I enjoy it from time to time. I never said it should never be
used or done away with.

I have only said that testing one's skill at it no longer necessary.

So you're saying code use "in this country" is jumping with activity? If so, where? I've looked in the commercial bands, shortwave broadcast bands, military bands, and so on, and found very little code use (certainly far less than just a few decades ago, just as I said).

> I'm gonna give you some free advice here, Dwight.

Now, let me give you some advice, Larry. You're too narrow-minded to even understand the concepts behind code testing. Code testing is not, and has never been, solely to benefit Amateur Radio. Therefore, you can't focus solely on Amateur Radio when discussing the code testing issue. So, for the sake of your own credibility on this subject, look outside your own narrowly defined little world at the much larger picture elsewhere (the view from the FCC's perspective). Only then will you be aware enough to seriously discuss this issue.

such is true with many newsgroups.. there are many more people lurking
and reading than posting, but when a post is made that incites the passion
in somebody to say something, they are quick to do it....

It's just unbelievable to me that while all of the
> > books talk about how wonderful and helpful hams are,

and they ARE for the most part... but what you're dealing with here
is a small portion, a minority of them that isn't really representative
of the whole. NG's are famous for having people with a chip on
thier shoulders to use as a pulpit for thier beliefs, since most other
forms of doing so have limits to what you can do or say.

it's a ham radio newsgroup, so I don't think CW is off topic.... and debate
isn't a violation of usenet policy (that's HALF of what it's for), what's a
violation
I believe is inflammatory, abusive behavior.

And there's little chance that will ever stop on ANY ng.

Or we can just listen to him check into the
Liberty Net tonight from "near --------
Ohio and bellyache along with the rest of
the Saturday nite malcontents and misfits. :)

And now for a prediction:

I predict that W9FAM will eventually replace
W1WCR as the LN NCS. He has an excellent
ability to pontificate about his past broadcast
days and all the world leaders he's alleged to
have met. Hogs the microphone and yammers on and
on, which is good, as since he's an ex-mainstream
broadcaster which no doubt drives the Liberty
Net regulars nuts. (it's always good to have an
embedded ringer eh?) His effect on the net regulars
is almost as good as a skunk in a circus tent.
Seems most of the regulars only check in long after
FAM's gone to another freq. or shut down for
the night. You can almost *feel* the frustration
from the usual bunch of paranoid fools reaching
the boiling point....even better than when the
nutcase from Sarasota would check in and
blabber and play tapes for a 1/2 hour stretch!
We just f-n love it - teee hee hee hee hee heee!!

Well thats easy, I will just be renewing an existing License, BIG difference
from the New Welfare Licenses.

And exactly how does the number of CW contacts made qualify one to make a judgement about the value of code testing as a license requirement? Again, code testing is not, and never has been, solely for the benefit of Amateur Radio (or solely to benefit CW operations on those bands). Code use is declining here and around the world. Looking solely at Amateur Radio, even the majority of those operators don't use code/cw on any routine or regular basis. Because of these facts, the need for a code testing requirement has vanished.

> Twenty-two plus years of OTA HF experience as a
> radio amateur, which has been about 80 percent CW,
> 19 percent RTTY and other digital modes, and 1
> percent phone. What's your breakdown?

I believe the question was what experience you have that makes you UNIQUELY qualified to judge the value of a specific TESTING REQUIREMENT. I don't see anything above that would make you uniquely qualified in this subject. Again, code testing is not, and never has been, solely for the benefit of Amateur Radio (or operations in those bands). Therefore, the FCC is not going to judge the value of code testing based solely on Amateur Radio. You have to look at the larger picture, Larry. At this point, you're still too narrowly focused.

Yes a post stating what it takes to learn CW and stating causes of failure
is indeed free of spin. If I had wanted to discuss the pro/cons of CW, as I
have in other posts, I would have done so.

Attitude is the key in almost every endeavor. I've succeeded in a number of things for which I had no talent but had sufficient reason to pursue. These include Morse code, music, and karate. I had no talent for any of them but did quite well simply because I wanted to.

Larry, one does not need to survive a house fire to make judgements about fire safety. Or be attacked by a foreign government to make a judgement about certain defense planning. Or live under a dictator to make judgements about laws affecting our freedoms. Or experience a business failure to make wise business judgements. Or experience anything else firsthand to make value judgements about it.

> (snip) You have not had that mode's unique benefits
> and advantages proved to you over and over again through
> years of daily OTA use. I have. (snip)

Again, this is not about Morse Code/CW use - it's about the code test requirement. I can have that operational experience without a test requirement and you can continue to enjoy the "mode's unique benefits and advantages" long after the testing requirement is gone.

Amateur Radio Newsline™ Report 1362– September 19 2003

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE

As you are aware, Amateur Radio Newsline is, primarily, an audio news service and this weeks newscast is very audio intensive. While reading gives the basic facts, we advise you to download the audio file at http://www.arnewsline.org/quincy to get the most out of the newscast in relation to our coverage of Hurricane Isabel and the role Amateur Radio played and continues to play in storm communications efforts. This is a story told in “sound” from the scene that really cannot be reported in any other way.

**

Amateur Radio Newsline report number 1362 with a release date of Friday, September 19th 2003 to follow in 5-4-3-2-1.

The following is a Q-S-T. Ham radio is there as a hurricane pounds the U-S east coast, the ARRL holds tight on Morse and more petitions are on their way to the FCC. Find out the details on Amateur Radio Newsline report number 1362 coming your way right now.

(Billboard Cart Here)

**

RESCUE RADIO: HAM ADIO AND HURRICANE ISABEL

Her name is Isabel. She is a hurricane that slammed into the United States East coast with gale force winds. Emergency services including ham radio were ready and waiting as we hear in this report:

--

Roaring ashore with winds of more than 100 miles an hour, Isabel made landfall along North Carolina's Ocracoke Island, crossing the Outer Banks around midday September 18th. On the west end of Ocracoke Island, sustained winds were measured at 80 miles an hour. Storm surge of 12 feet was reported I

Bernard Nobles, WA4MOK, is a Section Emergency Coordinator in North Carolina. He says hams mobilized over a large part of the state:

4:07 IN In emergency operations centers
OUT in the eastern part of the state

The action wasn't just in North Carolina. Hams throughout the eastern seaboard were in position, ready to provide backup communications. Only a few hours after the storm had moved ashore, more than 800-thousand customers were without power in North Carolina and Virginia. Bill Moraine, N2COP, is a Public

Information Officer in southeastern North Carolina. He says hams were providing a variety of communications services:

--

IN they really run the range of
OUT in northeastern North Carolina.

--

Morrain says High Frequency conditions were often deplorable with extensive interference. He says the Hurricane Watch Net was being relayed locally through both EchoLink and IRLP, the Internet Repeater Linking Project, to help overcome H-F problem. All along the storms projected path ham radio operators trained in emergency communications were in service or on stand-by alert. The Hurricane Watch Net was busy on 14-point-325 MHz. At the National Hurricane Center in Florida, amateur station WX4NHC helped with relaying storm reports. With hams throughout the mid-Atlantic region helping in the communications effort, Morraine said putting a number on those assisting would be tough:

--

IN We don't have a handle
OUT in this particular disaster One bit of good news.

--

Morraine says Isabel is no Hugo, referring to the devastating hurricane that slammed into North Carolina in 1989:

--

IN Thanksfully, Isabel
OUT about 105.

--

Hams were scheduled to staff the North Carolina Emergency Management Eastern Branch headquarters in Kinston. The amateur station at the state emergency operations center in Raleigh was also activating, with an umbrella of liaison stations being organized to monitor the 146.88 MHz repeater and the Tarheel Net.

The National Weather Service had hurricane warnings posted for parts of North Carolina and Virginia. Forecasters warned hurricane force winds were possible 150 miles inland, along with tornadoes.

As Isabel began moving north after landfall, flooding became a serious threat. At least one hotel in Kill Devil Hills collapsed into the ocean. Evacuations were being ordered along Chesapeake Bay.

In the hurricane's first day ashore, nearly 900 flights had to be cancelled, with some airports closing or limiting service. Up to a foot of rain was possible in West Virginia's hilly Eastern Panhandle, with between 6 and 9 inches of rain expected over parts of Pennsylvania. Amateur radio operators say

they will stay on the air helping--as long as needed.

For the Amateur Radio Newsline, I'm David Black, KB4KCH, in Birmingham Alabama.

+++

As David said, it was North Carolina that was the first to feel Isabel’s fury. Gay Pearce, KN4AQ, is in Raleigh with that part of the story.

+++

Amateur Radio was in full swing in eastern North Carolina as Hurricane Isabel made landfall on Thursday. For hams and everyone else, the term "made landfall" was a confusing one. High winds, rain and power failures reached the Raleigh-Durham area, 150 miles inland, well before the hurricane eye crossed the coastline.

--

IN: WAKE EOC POWER FAIL AUDIO]

--

The Tarheel Emergency Net, North Carolina's ARES net, was in operation, splitting duty between 3923 and 7232 kHz, depending on propagation

--

IN: HF COUNTY CHECK-IN AUDIO],

--

The North Carolina ARES group has not yet begun to use 60 meters.

Most traffic between the coast and the states Eastern Branch headquarters in Kinston was being handled on linked repeater systems.

Several hams have remained on Hatteras Island on the Outer Banks, and for a time, hams across the world could listen to them via Echolink and IRLP connections. That ended as power and phone service failed near the coast.

The National Hurricane Center in Miami continued to use the Internet links to take reports from areas where connections remained in place.

--

[K4JVP AUDIO]

--

There was some confusion early as too many sources of input were mixed together on one combined Echoink/IRLP conference. The National Hurricane Center's liaison station commented:

--

[HNC CONFUSION AUDIO]

--

Control operators were able to clear up that confusion, but locally, repeater operators are finding that they can't mix local emergency and logistics traffic with a full-time Internet connection that's carrying similar traffic on other repeaters. That's a lesson for the next emergency.

Repeaters were used inland as well. The wide coverage 146.88 repeater in Raleigh linked the State EOC with surrounding counties and the Eastern Branch headquarters.

--

[VHF COUNTY CHECK-IN AUDIO]

--

Shelters began filling up as the storm moved inland, but with most shelters located in counties that would receive at least Tropical Storm force winds and a possible loss of power and telephone service, Amateurs were dispatched to provide communications.

--

[SHELTER VOLUNTEER AUDIO]

--

Reporting for Newsline from the fringe of Hurricane Isabel, this is Gary Pearce KN4AQ in Raleigh, North Carolina.

--

More on Hurricane Isabel and the role of ham radio in future Amateur Radio Newsline reports. (Numerous sources)

**

Break 1

From the United States of America, We are the Amateur Radio Newsline, heard on bulletin stations around the world including the WR4AMS repeater serving Eastern Kentucky.

(5 sec pause here)

**

RESTRUCTURING: THE ARRL POSITION - WAIT TO HEAR FROM OUR MEMBERS

Why hasn't the ARRL joined those who have already filed petitions to the FCC on the topics of Morse Code testing and changes to license priveleges? In a note to his constituancy the League’s Southwestern Division Director Art Goddard, W6XD, explains it this way:

“After determining that the FCC will be handling these matters in due course, your ARRL has set a timetable that includes ample opportunity to

collect member input before determining its direction at the January 2004 Board meeting.”

Goddard says to say tuned for further developments. He also tells ARRL members to contact their own ARRL Director and make known their views on these vital issues.

Goddard also suppled a brief overview of a meeting in St. Louis this past weekend, where ARRL Directors and Officers took what he calls the next step to define the ARRL's future role in Advancing and Advocating Amateur Radio. Although the details of ARRL's Long Range Plan aren't yet complete, W6XD says that hams can expect to see bold new actions in several key areas. These include advocacy in key regulatory and legislative issues, lifetime learning, certification and personal achievement and public recognition of Amateur Radio as a valuable service. Goddard adds that there will also be financial stability to implement all of these strategies. (ARRL SW Div. Report)

**

RESTRUCTURING: MORE CODE PETITIONS COMING

The ARRL may be taking the correct road on this one. This is because the latest ham radio restructuring show appears to be only in its opening act. In fact, it looks as if the six petitions favoring abolishing Morse testing and the one from FISTS favoring its retention may be only the beginning of a deluge of requests from both sides in the issue. We have heard that there are a number of other petitions already at the FCC or on their way but know little about them. Our Bruce Tennant, K6PZW has more:

As we go to air we believe there are as many as another half dozen petitions being filed on both sides of this contriversial restructuring issue. Amateur Radio Newsline will keep following this story and will have more fore you in upcoming reports. (Various sources)

**

RESTRUCTURING: FILE ON EACH PETITION

Still with this latest round of restructuring. If you are among those planning to file comments on one or more of the Morse petitions already before the FCC then listen up. If you want to make known your feelings on all of them, then you will have to file separate comments on each one.

As of this moment, a comment filed on any one particular petition will be considered for that specific rule making request alone and not on all. And having read the petitions, we can understand why. Each one asks for a specific approach in handling the Morse question and it would be impossible to provide a one comment that would fit all.

By the way, as we go to air the FISTS pro-code request has still not been assigned a rule making designation by the FCC. (ARNewsline(tm))

**

RADIO LAW: CONGRESS MAY INCREASE FCC AUTHORITY TO ISSUE FINES

The Federal Communications Commission would be given the authority to levy significantly higher fines. This, if a bill being considered by the Commerce Committee of the U.S. Senate becomes law. Amateur Radio Newsline's Mark Abramowicz, NT3V, has the details:

--

The Wall Street Journal reports that fines for violating FCC rules could jump tenfold, and activities of lobbyists would be further restricted under a bill introduced in mid-June by Senator John McCain who chairs the Committee that authorizes the agency's funding. In addition to the increase in the Commission's authority to levy fines, the proposed legislation would also extend the statute of limitations on violations of the agency's rules from one year to two.

Other provisions include restrictions that would prevent top staffers from lobbying the agency for one year after leaving their positions, and a ban on the payment of travel expenses of FCC officials by companies and private interest groups. In other words, if the FCC were to send out a representative to any gathering the cost must be borne by the agency and not the events sponsor. Its far to early to know if such a prohibition would impact on the FCC ability to attend hamfests, conventions and other hobby radio gatherings.

For the Amateur Radio Newsline, I'm Mark Abramowicz, NT3V, in Philadelphia.

--

McCain's bill reportedly has the support of Senator Ernest Hollings increasing its chances of gaining broader support. Even so, it is still expected to face tough opposition as it makes its way through the regulatory aproval process. (Published news reports)

**

REMEMBERING : THE 2ND ANNUAL N2LEN 9/11 NET

The second annual N2LEN nine eleven net took place on Thursday, September 11tth. The gathering used voice over I P technology to link repeaters world wide over the Internet. This allowed radio amateurs and non-ham listeners to reflect on the terrorist attacks of two years ago and the role that radio amateurs played in the aftermath.

ARRL President Jim Haynie, W5JBP, was this years keynote speaker. He addressed the role of Amateur Radio in homeland security and urged each amateur to develop his or her emergency communication skills.

As with the 2002 net, this year's cyberspace and radio meting relied on EchoLink and eQSO Internet software connections as well as repeaters and simplex links around the world. (N2LEN Net News Release)

**

AMATEUR RADIO SURVIVAL: UCF CLUB EVICTED FROM ITS HOME

The University of Central Florida Amateur Radio Club station K4UCF has been evicted. This, from the campus location that it had occupied for 30 years. Mert Garlick, N6AWE, reports:

--

According to a qrz.com website posting from Matt Collins, KG4JYD, the eviction took place last June but seems only now to have been made public. It reportedly resulted from faculty complaints about the radio club who concluded that damage to computer equipment was from a lightning strike that entered the building through the club's antenna system. University's plant personnel also complained that club members worked on the roof of the building without authorization.

But Matt Kassawara KG4FEQ , has a differing view. Kassawar who is with the club says that the ham station is the closest equipment to the antenna system. He says that neither that equipment nor the club repeaters were damaged by a lightning strike, indicating that the clubs antenna could not have been the source of the damage.

The club requested that University of Central Florida provide comparable space from which to operate. So far UCF administrators have refused.

For the Amateur Radio Newsline, I’m Mert Garlick, N6AWE.

--

More information is on the web at qrz.com and http://pegasus.cc.ucf.edu/~wb4tcw/evictimeline.html (qrz.com)

**

ENFORCEMENT: NY COURT DISMISSES HAM SCANNER CASE

Some good news for a New York State ham as a court dismisses a misdemeanor charge against Richard C. Lalone, KC5GAX. This for allegedly for violating an anti-scanner provision that state's Vehicle and Traffic Law.

According to the ARRL Letter, in a 1300-word decision, Judge John J. Hallet said it was clear the legislature never intended the provisions of traffic law 397 from applying to licensed Amateur Radio operators. He then dismissed the charge against Lalone August 5th.

The law in question prohibits individuals in New York state -- other than law officers -- from equipping their vehicles with radios capable of receiving signals on the frequencies allocated for police use without first securing a permit. The section also contains an explicit exemption for any person who holds a valid amateur radio operator's license. (ARRL)

**

ENFORCEMENT: FCC ASKS POWER COMPANY TO TRY HARDER TO RESOLVE NOISE COMPLAINTS

The FCC has asked American Electric Power Company of Columbus, Ohio to take a closer look at several power line noise complaints and try harder to resolve them. This in relation to complaints filed by four Amateur Radio operators in

Ohio, Indiana and Oklahoma.

According to the ARRL Letter AEP responded February 10th to the FCC's initial correspondence regarding the four cases. But the agencys' Special Counsel Riley Hollingsworth says that follow-up reports from the complainants suggest discrepancies exist between what AEP told the FCC and what the complainants report.

Hollingsworth said evidence to date indicates that none of the cases has been satisfactorily resolved. In one case, AEP erroneously identified the amateur's own antenna as the source of the noise.

Now, Hollingsworth has asked AEP to revisit each of these issues and to update the FCC within 45 days of any progress in each case. He also referred the power company to ARRL RFI Specialist Mike Gruber, W1MG, for technical assistance. (ARRL, FCC)

**

ENFORCEMENT: PAGING FINE

The FCC has affirmed a $9,000 fine against Air Paging, Inc.. This for failure to operate its Wireless Radio Station in accordance with its station authorization, continuous radiation of an unmodulated carrier, and failure to provide station identification by the assigned call sign.

Air Paging did not file a response to the initial Notice of Liability, so the $9,000 figure was affirmed. In addition, the Commission does not know if Air Paging has corrected the various violations, so Air Paging has been given 30 days to outline what measures it has taken or will take to correct the violations and ensure that they do not recur. The entire mater is in cyberspace at
http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-03-2741A1.doc (CGC)

**

ENFORCEMENT: TWO MORE TOWER FINES ISSUED

The FCC has issued two more broadcasters hefty fines because of tower related violations. A monetary forfeiture in the amount of $10,000 was issued to Pinnacle Towers, Inc., owner of a tower in Des Moines, Iowa, for failing to clean and repaint its antenna structure to maintain good visibility. Dinged with a $3000 fine is Best Country Broadcasting, LLC, owner of the antenna structure located in Bogalusa, Louisiana. No reason for this fine was mentioned in the FCC digest for the Best Country fine. (CGC)

**

BREAK 2

This is ham radio news for today's radio amateur. From the United States of America, We are the Amateur Radio Newsline with links to the world from our only official website at www.arnewsline.org and being relayed by the volunteer services of the following radio amateur:

(5 sec pause here)

**

INTERNATIONAL - AUSTRALIA: BPL COMING TO VK-LAND

The problem of Broadband over Powerlines or BPL is about to hit dwn-under. This as Australia makes ready to give it a go. Q-News Graham Kemp, VK4BB, has the latest:

--

PLT, PLC, BPL. What ever way you say it it means noise. Now, the Wireless Institute of Australia - Victoria says there is now clear evidence of a PLT-C/PBL push in Australia. That no-one can continue to be in denial mode.

From the Q-NEWS perspective Barry VK2AAB will no longer be a "voice in the wilderness." Many of us will soon be asking "why didn't we act sooner".

You'll recall months ago we mentioned the little units being sold by DSE. Well these are small fry compared to the same basics being applied to our 240 volt mains supply, or worse, the High voltage distribution system.

--

It appears as id BPL is quickly becoming a world-wide problem for Amateur Radio. (Q-News)

**

RADIO LAW FOLLOW-UP: NEVADA TOLD TO SCRAP NEW RADIO SYSTEM

Here’s a follow up on a story we brought to you several months ago regarding a new state wide radio system in Nevada and an oversight by the regulators planning it. As previousy reported, the Nevada Highway Patrol had spent $14 million on a contract with Motorola to build a computerized radio system. It was activated back in 2000 but nobody from the state ever applied to the FCC for licenses for the frequencies. As a result, the FCC had told the Nevada Highway Patrol and other state agencies to stop using the 140 frequencies by last June.

To comply with the federal order, Nevada has had to scrap a costly radio system that's less than two yeas old. So on Tuesday, September 9th the Nevada state Board of Examiners voted to spend $16.1 million on new radio gear for the Nevada Highway Patrol. (Published news reports)

**

NAMES IN THE NEWS: W4FAL AND K2AD ELECTED NEW NFCC DIRECTORS

Some names in the news. They are Frank Lynch, W4FAL and Doug Sharp, K2AD who have been elected as Directors of the National Frequency Coordinators Council.

The NFCC made known the results on September 6th. This, after twenty-eigh of its member councils took part in the vote.

The National Frequency Coordinators Council is an umbrella group of recognized repeater coordinators. It was formed as the result of a meeting held in St. Charls Missouri in the late 1990's. (ARNewsline(tm))

**

HAMFESTS AND CONVENTIONS: QUEENSLAND AUSTRALIA ON SEPTEMBER 19-21

On the hamfest scene, the 30th annual North Queensland Amateur Radio Convention takes place September 19th to the 21st. The venue is down-under at James Cook University in the state of Queensland Australia. For details please e-mail vk4zz@wia.org.au (Q-News)

**

HAMFESTS AND CONVENTIONS: THE DX BASH IN TEXAS IN OCTOBER

Back on this side of the Pacific, the 13th Annual DX BASH will be held on Oct 10th to the 11 at Lake Buchanan near Austin, Texas. Icom has provided a IC-746 Pro and IC-756 Pro II that will be in use at the W5KFT contest station for attendees to try out in actual "on the air" conditions. Also planned are programs on operating, contesting, towers and antennas. More nformation is on-line at www.dxbash.com (W5KFT)

**

SWL-FESTS: SCADS IN HUNTINGTON BEACH IN SEPTEMBER

And short-wave hobbyists, this one is for you. Word that the Annual Southern California Area D-X'ers Picnic will be held on September 20th from 8am to 4pm. This, at the Huntington Beach Central Park in Huntington Beach California.

Huntington Beach is a suburb of Los Angeles. Further information available from Stewart MacKenzie, WDX6AA, at 714-846-1685 from about 9 a.m. to 8 p.m. - Pacific coast time. (SCADS)

**

DX

In D-X, if you are waiting for a Q-S-L card for last June's WB8XX operation on Antigua, you will have to be patient a bit longer. According to Kevin, cards ordered 2 months ago from PY2TNT never did show up and now it appears that the company maybe out of business. Kevin says that the website is suspended and E-mails bounce. WB8XX adds that he will be ordering more cards from a stateside supplier, and will have all of the cards out as soon as the 2nd order arrives. (VHF Reflector)

**

THAT FINAL ITEM: TEACHING HAM RADIO IN ALBANIA

And finaly this week, how would one of you like to teach ham radio in Albania? Yes, we said Albania. Well you can if you know the British Radio Amateur Examination course and like to travel. Here R-S-G-B Newsreader Jeramy Boot,

G4NJH, with the rest of the story:

--

A radio amateur lecturer is required to help give a radio amateur course in the Technical University of Tirana, Albania, this coming November. The course will integrate amateur radio communications theory and practice into the University's normal study programme.

The course is organised in coordination with the Ministry of Telecommunications in Albania, in conjunction with the IARU, and using RSGB documentation. Several agencies and companies are providing financial support. The applicant should have experience of
teaching electronics and telecommunications at the amateur radio level in a UK setting. The course material is based on the UK RAE at the Full licence level and will lead to a CEPT-recognised qualification for the successful students. The successful amateur will help to coordinate the other visiting lecturers, and the assignment will take three weeks out of a six-week program.

This is a unique opportunity to join a multi-national amateur radio team helping to create a new group of telecommunication engineers to benefit the Albanian economy. It will provide a rich experience, not to mention the opportunity to operate ZA1A from the hotel in any spare moments.

--

For more details, please contact Roger, G3LQP, by e-mail to g3lqp@aol.com (GB2RS)

One does have to eat a pizza to evaluate its taste and whether they will like it or not. I love pizza but hate tomatoes, cheese, and garlic. Yet combine them into a pizza and the result is entirely different. No one can tell how a cake will taste simply from reading the ingredients on a box. You can evaluate its nutritional content but not its taste. So while there are some things that do not need to be experienced to evaluate them, there are other things that do.

Yup, no one who had any real dealing with them personally, or through
family would ever spout that off. That's why Godwin's law is what it is.

We can have plenty of fun in here arguing with each other without
resorting to that.

Think about it Clint.

With present day wind turbine technology, quite a bit. However, I was mainly speaking of suplimental power at this point.

> And the other side of Puget Sound doesn't have "plenty
> of wind". It's higher than Seattle but still much lower than
> many other areas of the country.

Are you kidding me? I lived on the other side of Puget Sound, on a cliff overlooking the Sound (just on the outskirts of Bremerton). Wind was routine and more than plentiful. My antennas were knocked down several times and I often had to wait several days for the wind to die down long enough to put them back up again. I never had a completely windless day to put up an antenna.

The wind even knocked down a twenty-five foot antenna structure with six metal guy wires holding it up (something I thought was impossible, especially since I put that structure up to survive strong winds - my emergency antenna system). On another occasion, the wind pulled a nine foot guy stake (one and a half inch thick metal rebar) right out of the ground on my main antenna structure.

Believe me, the Olympic Peninsula gets more than enough wind to drive wind turbines. In fact, the whole area around Puget Sound gets plenty of wind (wind dropped the Tacoma Narrows bridge years ago). The other side of the Peninsula, facing the ocean, gets even more wind. Even Seattle was rarely windless, especially in the winter months.

I'm simply saying that lack of talent is not a sufficient justification for refusing to learn something. I'm saying that motivation is many times more important than talent. If a person doesn't want to learn something, say so. Don't try to justify it with the lack of talent argument. I've seen enough untalented people achieve their goals to have little patience with such rationalizations.

Especially after the news reporters spiced up the stories for the cameras. Did you pay attention to some of the broadcasts? Some of those reporters were acting like the world was coming to an end.

The one that had me laughing the most was the woman holding onto the huge cement flower pot as she talked about being blown away if she didn't hold on. While all this was going on, her thin nylon windbreaker was hardly moving. I saw the same reporter later hanging onto a light pole, again with her clothing hardly moving in the wind.

Another funny moment happened towards the beginning of the storm. The reporter was talking about how the area looks "like a ghost town," just as a bunch of teenagers passed behind him playing catch with a football.

And, now, the same reporters are out searching for that one damaged building, that one fallen tree, that one flooded street, in a mostly undamaged area, to put on the evening news like that is the typical situation throughout the path of the storm. It would all be hilarious if it wasn't for the bad impression it creates elsewhere (and the mostly unnecessary disaster aid it garnishes).

Must have lived in a different Seattle than I did. There was seldom any
significant wind of any kind. The Tacoma Narrows was an unusual situation.

The local geography in that area created a "wind tunnel" effect specific to that location. When it hit the resonant frequency of the bridge, the oscillations exceeded the strength of the bridge. That resonant frequency could only be triggered by a specific wind speed. If the wind had been either weaker or stronger, it would not have happened that particular day. It would have happened sooner or later however.

Your location could easily have had a similar problem.

I spent several years living in Seattle and was out and about almost every weekend, including the Olympic peninsula and up into the mountains. Winds were minimal.

However, the fact that most of the time, winds were minimal does not mean that high winds cannot occur occasionally.

Very well said, Dee - anything is possible if you want to do it badly enough.. I am certainly no prodigy at morse, electronics, martial arts, cooking, business management or anything else - but I have always been able to accomplish the things that I was motivated to do. Mind you, it took me until I was 45 to become motivated enough to learn morse code - but I wanted to get on HF, focused on the goal, bought some training software online and passed the 5 wpm test four weeks later. Conversely, I have wanted to learn to play the guitar since I was a teenager - not sufficiently enough, though, as I never did do it. Which, in retrospect, is probably a good thing....

Talent has very little to do with accomplishment (it does relate to the level of excellence that one can attain, but to become reasonably proficient in anything talent is not a factor), especially in ventures based primarily on rote repetition like morse, Karate, or learning a language. Aptitude and motivation, yes, but not talent. Otherwise, I'd have accomplished nothing so far :)

Blaming a lack of talent for failure to accomplish something reflects on a persons' own inability to accept responsibility for their own actions - successful people, quite simply, go out and get what they want. Or, in the words of Albert Gray:

"Successful people are successful because they form the habits of doing those things that failures don't like to do"

I don't know hardly any code haters myself. I myself aren't one, I enjoy using it. Most the hams I know either love it or are indifferent towards it, that is, they have no opinion on the use of CW one way or the other.

It's the testing of a skill that you may or may not elect to use that I think meets rejection.

He comes in calls us the most repulsive people on the face of the
earth, remember the N***S? and then says this?

I still want to ask if this is the brave new ham type that we have to
look forward to after Morse is gone.

AH, that was what you were referring to... well, youre definition of
"abandon"
seems to differ from mine, as I used it once and only once and that was
referring to the really extreme, hardline CW pro-testing crowd.

Um, you said your polish ANCESTORS knew the national socialists in wwII
germany... as in, not *you*... so, therefore, I will assume you don't know
what it *really* means, nor do you have a clue or to whom it refers;
by the very same definition; therefore, YOU are disqualified as the
judge of same.

If you have been hiding in a cave for the last many years and didn't bring
yourself out into the sunlight and fresh oxegen long enough to know
what the reference means, then i'll educate you. It was a symbolic
reference to any group, such as the brown shirts of the aforementioned
group, and ultimately the national socialist party itself that ascended to
power, of ramming thier radical ideas down people throats without
regard to anything but it's own desire and wishes, no matter how
useful, unuseful or down right malevolent.

well, this argument, like all of the PCTA arguments, is easy to knock over the fence and make a home run out of... right out of the ballpark, so here goes...

if you want to claim knowledge and right of discussion on a matter due to your lineage OR your association proximity to somebody that actually MET a person/group/<insert noun of choice>, then allow me to inform you that I had an uncle that actually served in the european theater as well as one that served in the south pacific against the japanese. A little closer to me in age than a grandfather, greatgrandfather, or third cousin twice removed on your mother's side sevearl generations back by marriage to the local meat butcher or whatever. Until the passing of my uncle who served in europe (and god bless, didn't get killed), I was able to speak directly to him on the matter and got first hand knowledge.

And know for one more bit of educational matter, if your cranium has the capacity to absorb data at this rate..... if the learning process of the human race were limited to contemporary times, and there were no history books (as socialists would love dream of), and there were no processes by which a person could be educated to more than his 5 senses could teach him, than civilization could not exist; we would never advance to one digree, to the nth degree, to NO point whatsoever if the learning process weren't available to us to discover that which we haven't found to be true with our own experience. You would not be aware that this is but one planet in a 9-planet solar system; that one hundred million plus one hundred million equals TWO hundred million... or any other fact or detail that could not be learned in a single solatary person's lifetime on thier own.

So don't try to claim that a person can't know anything unless he or she saw it for themselves, and couldn't learn it through thier elders. It quickly makes you appear as though you don't understand the process of education and, therefore, must

have NONE yourself.

I have and reject the premis of your argument.
It sounds as though the PCTA crowd is really sour that they have
been correctly labeled for what they are, and are so mad about it
that they're resorting to some sort of bleeding heart tactic to side
step the argument. You must be liberals.

If you do not like what I say, then you have two options; do not
read my posts, or, crawl under the covers and hide from the
coldness of reality and the true sensations of the world...
...and put me on your "block senders" list.

OH, you're logic (or lack thereof) is SO easy to beat!
But i'll do it anyway, even though there isn't a challenge in
it.... i'll do it by anology.

> Oh bull....you are so advocating something.

yes, i'm advocating changes to the LAW, not directly
to people... a change that is more of a freeing up,
a liberation if you will, than an imposing of ideas
or an order onto people.

I'm advocating the "stopping" of something,
not the "imposing" of an idea onto people.

If you had a law passed that said "everybody must
wear a blue shirt in order to get a job", then, that
is IMPOSING something on somebody, perhaps
against thier will. If you successfully do it, than
you HAVE imposed something upon PEOPLE.

if I, then, advocate removing that law, saying "I
think that a person shouldn't HAVE to wear a
blue shirt, as it's not necissary to do a job.. you
can wear any color shirt you like", how is
that IMPOSING anything on a person?

OH, I get it.. you say that by advocating freedom
of choice, i'm burdening people!

"we shouldn't make people put up with all these
freedoms of decision! we should MAKE them
do what WE think they should do!"

just what does that, or WHO does that, sound
like?

And if your to dumb to know
> what it is......your advocating the ellimination of Morse Code from the
> Amateur Service. Care to try that again?
>

and ONCE again, you have revealed the SPIN that the PCTA is
trying to put on people such as myself. People like myself simply
advocate the removal of TESTING. Why do you fellows REFUSE
to ackowledge that? you don't like the idea that we are advocating
freeing up unnecessary legislation and regulation, so you try
to SPIN it into us saying "we want morse code OFF the ham bands!"

and it's not true.

I think you want to frighten people into believing that, because the truth finds a much better flavor with most people..... but, you won't succeed, because each and every time you try to spin the issue you will be countered by others such as I.

REPEAT: I, and most other NCTA's out there, advocate ONLY the removal of morse code TESTING; not it's ELIMINATION from the ham band.

See? you're argument fails because you're trying to argue the wrong point.

you really have some thick reality filters there, don't you? or, really,
it's not
even reality FILTERS, you have reality MODIFIERS.

I have posted several times in here that I've passed morse code testing,
and my first QSL cards were using the CW mode on 15 meters... and
I still ocassionally use CW.

I just don't believe people should be FORCED to learn it if they don't
want to.

Just who is being more imposing here, somebody who says "you shouldn't
have to do what you don't want to", or "you should do what you are
told and SHUT UP" ??????

I'm matching wits here with an unarmed man.

No my analogy is quite correct. To determine the worth of pizza, you must eat to see if it is a food worth your bother. Knowing the ingredients will not tell you that. Watching other people eat one will not tell you that. Same with Morse code. Reading about past and present usage, looking at the table of dots and dashes, and watching other people operate, etc will not tell you whether you like it. It will only tell you what it is and what it is made of. Until you experience using the code for yourself (i.e. eating the pizza for yourself), it is impossible to tell whether you will like it.

well, this argument, like all of the PCTA arguments, is easy to knock over the fence and make a home run out of... right out of the ballpark, so here goes...

if you want to claim knowledge and right of discussion on a matter due to your lineage OR your association proximity to somebody that actually MET a person/group/<insert noun of choice>, then allow me to inform you that I had an uncle that actually served in the european theater as well as one that served in the south pacific against the japanese. A little closer to me in age than a grandfather, greatgrandfather, or third cousin twice removed on your mother's side sevearl generations back by marriage to the local meat butcher or whatever. Until the passing of my uncle who served in europe (and god bless, didn't get killed), I was able to speak directly to him on the matter and got first hand knowledge.

And know for one more bit of educational matter, if your cranium has the capacity to absorb data at this rate..... if the learning process of the human race were limited to contemporary times, and there were no history books (as socialists would love dream of), and there were no processes by which a person could be educated to more than his 5 senses could teach him, than civilization could not exist; we would never advance to one digree, to the nth degree, to NO point whatsoever if the learning process weren't available to us to discover that which we haven't found to be true with our own experience. You would not be aware that this is but one planet in a 9-planet solar system; that one hundred million plus one hundred million equals TWO hundred million... or any other fact or detail that could not be learned in a single solatary person's lifetime on thier own.

So don't try to claim that a person can't know anything unless he or she saw it for themselves, and couldn't learn it through thier elders. It quickly makes you appear as though you don't understand the process of education and, therefore, must have NONE yourself.

Clint,

This is not a game where you hit home runs. This is a serious subject. I'm a few years older than you, so it stands to reason that I've had the opportunity to speak directly with many of the members of my family who survived the Nazis' attempt to exterminate them in Poland. I listened to them many times over as a young man and understand fully the meaning of the word. I don't subscribe to your loose definition, and neither do the many people who lived under that tyranny. When you use it to describe those that are in favor of code testing in the ARS, you cheapen the meaning, and

therefore the memories of all those people who did not survive. Please, think about this before you use the word again. That's all that I ask.

Better be careful that you don't drive too many Echolink critics
crazy. Remember: They claim that it isn't "real ham radio."

How can they explain the fact that it was heavily relied upon in
an emergency situation which the "real" service couldn't handle?

Clint, not only can Dave be the smuggest of PCTAs on r.r.a.p., but he
has a certain penchant for obtuseness. He is a master of not
understanding whatever it is that isn't going his way.

Poor DICK. I guess you missed the entire point that useful satellite
information could be sent via Morse/CW, if you were willing to develop
the protocol and the overlay grids, similar to the old gridded radar
bulletins.

For what its worth (FWIW), real satellite data isn't pictures, isn't
FAX. It is rows and columns of pixels, each with a value ranging from
zero to 255, seven layers deep. They are formatted into data groups,
and 'puter programs display and/or animate the data with various

enhancement curves (algorithms) which make the DATA more useful.

There was some confusion early as too many sources of input were mixed
together on one combined Echoink/IRLP conference. The National
Hurricane Center's liaison station commented:

I guess you kinda forgot about the part where the EchoLink stuff shut down the instant the power went down, making it utterly useless for any kind of communication, especially emergency communication. Forgot to quote that part, huh?

An honest oversight, I am sure.

When a standard must maintained, whether it be a ham license, or a pilots license, then a test is required. Otherwise the quality goes down.

CW is a tradition in the ARS. It is a valuble mode of communications. However, it requires a certain amount of dedication and desire to maintain your ability to work the mode.

In otherwords advocating freedom of choice has nothing to do with getting a ham license. People SHOULD NOT be able to force a change on the licensing authorities, based mainly on being too lazy to try to meet the standard.

Why should those of us that have the dedication have to be forced to have
our privlidges reduced by those among us that are too lazy to bother to meet
the standards we did? Should be rejoice at this? I don't think so.

We know that is what you SAY. The reality of the situation is based on the
simple knowledge that human beings will take the easy way. Once CW testing
is elliminated, CW use will eventually dissapear. Folks simply will not
bother to learn it.

I honestly don't think that 5 words per minute is asking too much to gain
access to a large part of the spectrum. I can see your bitch about 20 and
maybe even 13. But for GAWDS sake....5wpm....ANYONE can do that.
Especially with the multiple guess test. Give it a rest. Pay your dues.
Even if it is only half price...or less.

Attempt you insults all you want to Clint. I still say you know nothing and
have no experience in the mode.

If you don't run over 18wpm consistantly, and are able to sit down and copy
in your head. And have done so for years. Then may statement is true.
You have no concept.

And with you smart assed attitude you never will.

Arnie,

This Clint character uses this sort of 'arguement' on everything he does. Yet he claims 'knowledge' of the subject after saying basically that unless you were there, you know nothing about it.

He shoots himself in the foot here as he does with the pro code testing commentary. In fact his arguement proves he is just being a world class smart ass.

In otherwords let it go Arnie. May I express my sincere regrets that you have such a knowledge of those NAZI bastards.

And I think YOU are FRENCH!!! Are you French, Clint?

It is fascinating to read your repulsive posts about equating Pro-coder with Nazi's. Just fascinating. However, you have convinced me of one thing.I think you are perhaps the epitome of the No-coder, the brave new ham that takes the ARS into the 21st century.

Nahh, I will read your posts, and in the off chance there is something of intelligence in them, perhaps I will reply. I read everyone's posts. No need to crawl under the covers.

OK, fine.

>However, I had no
>aptitude for the subject, and still don't.

That cannot be true, or you would never have been able to pass the test at all.

>Who knows why I should be good
>at science and languages, and yet lousy at woodwork and CW, and yet it's
>so.

Could part of the answer be...attitude?

>Each of us has innate abilities in some things, balanced by innate
>incompetence in others, i.e everyone is unique.

Where I work, we have the saying:

"Everyone is good at something"

>I feel that this has been
>ignored by the pro-code side of the debate, or rather that it is known
>damn well, but none of you will admit it!

Not at all! People have varying levels of innate ability.

Passing the tests, however, do not require anything like an expert level of
skill, nor much innate ability.
>

>It is possible to learn something that one is no good at in order to pass
>a test, although unlikely that practical fluency in the skill would ever
>be acheived.

Maybe not. But practical fluency is not required.

>It is even possible to learn something that one is both no
>good at and has no interest in, although much harder, and then the level
>of difficulty becomes crushingly hard.

There ya go - addy-tood.

>without which I would never have succeeded on my own. The reason I didn't
>succeed earlier is straightforward - I didn't get help before.

If you believe you cannot - you cannot.

Had someone told me when I was growing up that someday I'd complete marathons,
I'd have said they were nuts. Never saw myself as "athletic". Never involved in
sports at school in any way. Did not start road running until 1981. Yet by age
30 I was a marathoner.
>
>So there it is. I have a negative attitude, coupled with zero aptitude,

>first place. That's all. No PSK31, no SSTV, no RTTY, etc. Boring and
>limited to some, but if you prefer CW or PSK, or WHY, then you're welcome
>to use them.

OK, fine.

Now take that attitude and argument and apply it to the theory part of the
written test. Keep in mind how many hams today use manufactured equipment, and
how few would actually attempt to repair their gear.

> "bad mail" from others.
>
Nope. It's not relevant.

And, it's just common sense that no matter what job I hold/held, and no matter who my employer(s) are/were, they would not make any difference in your behavior towards me.

> I think your REAL fear is just in everyone discovering you don't do a
> damn thing in radio for a living.

Nope.

The only REAL fear is yours, because you desperately want to know, but I won't tell you.
>
> No problem for me. I've revealed most of my employers in here, plus a
> number of personal references who are long-time licensed radio amateurs.

None of the employers had anything to do with amateur radio. They're irrelevant to the discussion.

You want to knwo them for reasons that have nothing to do with amateur radio.
>
> You won't do that.
>
I've given a number of personal references who are long-time licensed radio amateurs, too, Len.

But what's really relevant is what a person has done in amateur radio. I've been an active, licensed radio amateur for almost 36 years - operating, building stations, writing articles, elmering, etc. You wrote a few basic articles for a now-defunct amateur radio periodical and have never held any class of amateur radio license.

> All you seem to want is some kind of "rep" in the newsgroup for being here

Sounds like you're getting angry, Len. If you don't have a checkered past,
there's nothing to admit. Your anger *may* indicate a guilty conscience....;-)
;-)

Either you bootlegged before 1949 or you didn't.

Which is it?
>
>>It's more than you had done in RADIO at that age.
>>
>>And mine was legal. No bootlegging.
>
> YOU didn't exist in 1947...or 1948.

Doesn't matter.

What I did at 13 is much more than you had done at age 14.
>
> By February 1953 I was already (at 20 years of age) a soldier serving
> overseas, assigned to an Army radio station with the callsign ADA.
> I was with ADA for three years.

Fascinating - you were 14 in 1948 but 20 in early 1953.

> You've never served in the armed forces of the United States, much less
> "assigned overseas."

I never claimed to be. How is that relevant to amateur radio or bootlegging by
14 year olds?
>
> You've made fun of my military service in the past. [that's in Google, by
> the way, you seem to live part of your time there...]

Where? Produce the post.

I dare ya! ;-)

Shall we google up your frequent insults and denigrations of others' military
and government service?

For example - how about the way you made fun of Jeffrey Herman's Coast Gurad
shore station radio operating?
>

> You want to be honored a respected for being safely within in the USA

>>they have to memorize all those symbols, diagrams and formulas?"
>
> Those aren't "questions" except to the loaded, "do you still beat your
> wife" sort of "questions."

Not at all. The "do you still beat your wife" question is only "loaded" if the
answers are confined to "yes" and "no".

There's no such restriction on those questions.
>
> They don't have to be "answered" because YOU don't have one single
> bit of "authority" to demand answers.

Not demanding. Asking.

You don't like those questions because they demonstrate a *MAJOR* flaw in your
jeremiads against Morse code testing.
>
> Take pride in your work for a living. Reveal at least the area of
>"electrical work" you do.

I already have. Electrical engineering. Design work, to be precise. That's all
you need to know. ;-) ;-) ;-) ;-)

If that makes you angry, it's your problem, not mine.

Even that is irrelevant to an amateur radio policy discussion.
>
> Either way, ALL you are is an AMATEUR who tries to pass hisself off as
> a great big guru in AMATEURISM.

Is being an amateur somehow bad? Amateurs do things for the love of the thing alone.

You are not a radio amateur. Nor have you ever been. And that's a fact.

As for "guru", that's all in your imagination. I don't claim to be an "expert" or "guru" in anything. Not even Morse Code.

As well it's unfortunate we know people that think that it is a fine
argument technique to invoke them as a pejorative description. That is
sad, sad sad.

It is also indicative of a person that doesn't play well with others

As I noted in an earlier post:

> We can have plenty of fun in here arguing with each other without
>> resorting to that.
>>
>> Think about it Clint.
>>

and he replied:

>
> I have and reject the premis of your argument.

Sad to think that a person believes that it is important to call people
that whether right or wrong, believe that the extra knowledge of a Morse
code test are equal to the worst scourge ever unleashed on the face of
the earth.

Coupled with lectures to Dee on what her taste bud do or don't do.

Its clear...

Clint doesn't play well with the other boys and girls.

>(wind dropped the Tacoma Narrows bridge years ago). The other side of the
>Peninsula, facing the ocean, gets even more wind. Even Seattle was rarely
>windless, especially in the winter months.

The FIRST Tacoma Narrows bridge was designed WITHOUT sufficient thought about sparse, elegant-looking minimal structures acting as airfoils during high winds. At the time of construction, the first Tacoma Narrows bridge was the third-longest single span in the world. It was open for nearly a year and developed such severe oscillation (as a result of the airfoil effects) that it was dubbed "Galloping Gertie." :-)

The high winds in the Narrows region proved too much for it in the 1940s just before WW2 and it went into catastrophic structural oscillation. It was rebuilt a decade later and has remained standing for half a century.

Tacoma Narrows bridge is a major passageway for vehicular traffic from the Kitsap County to the Tacoma city region but, at two lanes each way, has become too crowded for modern traffic. A third Narrows bridge, adjacent to the second, is planned to begin construction in the near future. The second Tacoma Narrows bridge still retains a little windsock at each end and warning signs about High Winds affecting both bicyclists and pedestrians. Every once in a while a high-box trailer will begin fish-tailing while crossing and may temporarily disrupt traffic, all due to high winds.

Eastern Washington still exhibits more severe winds than Western Washington, just not as often.

He is FASCINATED by her, almost to an obsession.

That could derive from his imagination and not being able to get a real
date himself (imaginary foreign "girlfriends" aren't real).

One more plus for monotonic on-off tone patterns listened to for too long.
No way to deduce clues as to the other morseperson's gender, age, or
much of anything else except to produce on-off monotonic tone
patterns called (colloquially) "CW."

Of course, Larrah could be out this Saturday getting fitted for a bra...

Yet you had enough "Polish ancestors" that survived so that you were
created...

Are ANCESTORS now to be a "credential" for qualified commentary on
amateur radio?!?!?

Radio as a communications medium was first demonstrated in 1896 in
Italy and in 1896 in Russia. Electronic history doesn't have much to say
about Polish radio.

The acronym "NAZI" is formed from German words meaning (literal
translation) 'National Socialist Party.' [National Socialistiche Partei]
In the pronunciation of the German word for 'National' it sounds to have
a Z in it, therefore the acronym has a Z in it.

>You seem to use the
>word with abandon, without having a single clue as to what it *really*
>means, and to whom it refers.

In colloquial American English, the word 'nazi' (all lower-case) has come
to mean nearly any in-your-face extremist group wanting Their Way (or
else!). Hence "smoking nazis" and feminist "nazis" sometimes referred to
as "feminazis" as two examples.

Do you need any more help on etymology?

>data tansmission.

Only in "Tansania." :-)

At home, my wife and I enjoy watching and listening to cable service that
is ALL DIGITAL carrying many more TV channels than the old analog
cable service PLUS carrying over three dozen binaural, Dolby enhanced
specialty music channels carrying both voice and music.

US military field radio routinely uses DIGITAL modes in sending all kinds
of communications material...facsimile, scanned images, voice, text,
almost anything. In the field or at permanent bases. No problem.

Why DO you have such a problem with newer technology?

>> But all that is old technology. Today, we get our weather via
>> wideband, though you're free to play with UKMO and NAM transmissions.
>

"Coded letter groups?!?!?"

Old-timer, you are still STUCK in technology of a half-century ago.

Even then, "coded letter groups" were fast disappearing in encrypted communications. [those are alive only in fictional novels and in the minds of old-timers]

>> Couldn't be much of a difference since you obviously don't know why.

Riiiiiiiigt... :-)

Outside of sounding like low-grade bullshit, that "reason" could be taken as wanting a government WELFARE program to preserve morse code.

If morsemanship is so damn much fun, easy to learn, etc., then it can be done WITHOUT needing the subsistence of any federal testing.

>>> And it is my right as an American Citizen to make an

All Dwight said was that "your words reek of bigotry, elitism, and
discrimination against other Americans."

If you want to sound immature, do continue in your demonstrated mode
instead of trying to present cogent counter-arguments. [that would be a
refreshing change...]

>Yawn! However, I guess that
>works for you NCTA's, in the absence of any truly valid reason for the
>further dumbing-down of licensing requirements in the ARS.

"Dumbing down" would be accurate for the Archaic Radiotelegraphy
Society (ARS).

However, in the United States, the Amateur Radio Service is NOT all
about morsemanship. Therefore, trying to KEEP the US ARS at 1930s
standards and practices is definitely a DUMBING DOWN...and you ARE
guilty of that.

>>Are you comfortable with some of the things said by those with

>
>And it is my desire that the ARS continues to have at least that "small
number"

>of CW-using hams among it's ranks. I don't think that's too much to ask.

That can still be done...WITHOUT testing.

If YOU want to TRULY support personal initiative without "government
support" (and all its 'evil' socialist-like things) then you should be able
to eliminate the federal code test!

Except you do NOT. You keep demanding that the government continue
the federal code test in order to keep a few code users around...

H Y P O C R I S Y

>And it is my belief that unless we preserve code testing, those goals cannot
>be fully achieved.

You seem very confused. First you damn all that federal government
welfare...then you demand that the government keep on testing code.

>>Therefore, any testing requirement
>>must be judged within the context of each of these. The code testing
>>requirement fails in each regard.
>
>Just the opposite is true. However, as previously stated, you are not
>qualified to make any judgment against the code testing requirement,
>since you have not gained practical operational experience in this mode.

Reducto ad absurdum judgement.

The FCC regulates and licenses ALL civil radio in the USA...yet none of
the staff nor commission of the FCC is required to pass any morse code
test in order to regulate US amateur radio.

You seem dumb and dumberer to the fact that every other radio service
(except a small part of maritime radio) in the USA has either DROPPED
morse code skill or never considered it as worthwhile when that service
started. Morse code is "alive" only in AMATEUR radio...and then only as
just another recreation.

>You have not had that mode's unique benefits and advantages proved
>to you over and over again through years of daily OTA use.

Every other radio service that ever used morse code, not only "daily"
but in 24/7 use, has DROPPED it. There were NO "benefits" or
"advantages" there that they found. Had there been any, they would
have kept it.

> I have.

You are NOT any sort of "authority." You pretend to be one, but your
pretense is transparent.

>And I didn't go into ham radio as a CW "lover" by any means -- in fact,
>I was a dedicated NCTA at the time. I came across to the other side
>due to my own experience with Morse/CW, and thus became a True

>Believer.

Nonsense. You were able to achieve tested proficiency in code by passing a 20 WPM federal test...that enabled you to get an Amateur Extra class license so that you could now have SOME kind of "high" award for your life experience. That rank-status-privilege artificiality allowed you to be "better" than "lower" classes.

>I'm reasonably sure you'll ultimately get your way, since that's the
>direction this country is going in general -- down the tubes.

Not really. YOUR life may be going down the tubes but the rest of us are rather firmly involved with optimism and are forging a brighter future even for those who, like yourself, remain rooted in old ways, old values, old standards, old practices, with a strict moral-superiority code stuck in your own ego.

Get some mental therapy, Roll. It will help you in the long run.

> all of those servers with a power outage.

Lloyd is right, you know.... The only part of EchoLink that shut down was the part that was in the area affected by the emergency, when the power went off.

In places unaffected by the emergency, it worked just fine! In this respect, EchoLink is every bit as valid and effective as a phone number you can dial to report a problem when the phone lines go dead. As long as there is no emergency the system works just fine!

Once the power shut down in the affected area and EchoLink went belly-up, the real Hams were still able to communicate with Ham Radio by use of battery power, as in their vehicles, or with power from a generator... Only the non-Ham stuff like EchoLink was dead, and in many parts of the northeast, EchoLink is still dead as this is being written, a few days after the storm hit.

No power, no phones - No EchoLink... That's one difference between EchoLink and Ham Radio.

Amateur Radio is independent of non-ham communications carriers; EchoLink of course is not. Not independent, and not Ham Radio.

> Anybody using a battery-powered laptop with a phoneline or satellite
> link would have stayed in business just fine.

Grasping at straws already, huh? Didn't take long, did it?

In packet radio, we call the "amateur telephone" devotees who cannot differentiate between Ham Radio and the non-Ham stuff "LandLine Lids". I suppose you must be another type of LandLine Lid.

You know.... The kind of guy whose idea of responding to an emergency *as a ham* is to demonstrate their ability to use the telephone. Since he's a Ham, his phone conversation is of course "ham radio"... Riiiiiight!
;-)

>It's no different than
> using an emergency-powered ham station, except that it's a lot more
> reliable.

I'd ask the hams in the areas with no power before I put forward any radical statements about how "reliable" EchoLink is with no Internet connection. You don't want to end up looking stupid and dishonest by making unsupported and unsupportable statements, do you?

>
> Echolink is the wave of the future AND YOU JUST CAN'T STAND IT!!!!

EchoLink is an Internet chat, nothing more and nothing less. As far as that goes, it is no better or worse than any other Internet chat. The only unfortunate part about it is that some people are easily confused by EchoLink, thinking that it is Ham Radio. It distracts them from the real thing, leaving them totally helpless and unprepared in the case of an emergency.

>>
>> No more "irrelevant" than your constant BULLSHIT about morsemanship.
>
>It's not bullshit, Lennie. I can do it, and I can prove it!

Irrelevant to any necessity of morse code testing.

The ORIGINAL need for morse code tests of radio operators (back in 1912 or so for the USA) was that the government needed some way of communications with ALL radio users in order to mitigate interference.

Way back then the primitive technology of early radio permitted ONLY on-off keying. There was NO voice, "data" (teleprinter), television, facsimile, or anything...just on-off keying.

"Morse code" was already established in wireline communications, having begun in 1844. Since the Morse-Vail telegraph involved ONLY on-off keying, the mode was readily adapted to primitive radio.

Radio as a demonstrated communications medium is only 107 years old and the first USA radio regulations came about 91 years ago. Electronics technology has progressed rapidly since then. Except for some sporadic developments by amateurs, the technology of amateur radio has been advanced almost entirely by commercial designers-manufacturers of amateur radio equipment.

As of today, "morse code" is ONLY required for amateur radio licensing and one small area of US maritime radio. EVERY OTHER radio service has either dropped morse code modes or never adopted it in the first place. There is NO NEED for "all" radio users to know morse code in order to mitigate interference...modern communications methods used by

the governments are faster, clearer, and more direct than morse code mode communications.

The FCC is NOT chartered to maintain some kind of Living Museum of The Airways to keep any level of proficiency of morse code alive. The FCC is the ONLY authority for regulating US civil radio. Larrah Roll is not an authority, the ARRL is not an authority on amateur radio regulation.

The FCC does NOT require any staffer or commissioner to pass any sort of amateur radio test in order to regulate all US civil radio. That's the LAW.

>> EVERYONE ELSE in radio but certain amateurs, maritime radio
>> included, have dropped morse code modes. Morse doesn't work
>> well enough for communications...doesn't really "get through when
>> nothing else will" and isn't a "universal language."
>
>And the above is meaningless, since you're not a qualified judge of
>the Morse/CW mode. End of story.

Reducto ad absurdum rationalization of self-defining ego.

Larrah, you are so FAR from a competent "judge" that your comments are a travesty of debate-discussion.

The JUDGEMENT of EVERY OTHER RADIO SERVICE IN THE USA should be sufficient for anyone with common sense. Morse code had its day long ago with primitive early radio. That has past. "Spark," once the only viable radio transmitter technology for amateurs, is outlawed. Morse code is NOT a necessity for anything except: "All hams should do like the long-time hams had to do it...pass a code test."

US amateur radio is NOT any Living Museum of Radiotelegraphy Arts, by either law or common sense. There is NO law on any books saying that morse code skills must be preserved via testing forever and ever.

>> I've been far more INVOLVED with civilian communications than any
>> early military radio. On the engineering level, not as an amateur
>> hobbyist.
>
>Still meaningless, since amateur radio operators ARE hobbyists.

That must be incorrect since a few hams insist that amateur radio is a SERVICE. Some are artifacts on display at the imaginary Living Museum of Radiotelegraphy.

>Your
>experience may be relevant to commercial or military communications
>environments, but not to the AMATEUR radio service.

My experience as a radio-electronics HOBBYIST began in 1947 and continues to this day.

Electronics encompasses a very large field of endeavors and activities
which is NOT limited to a little niche called "ham radio."

To repeat, the FCC does NOT require any staffer or commissioner to
pass any amateur radio tests in order to be the SOLE JUDGE and
REGULATOR of US amateur radio.

>I really don't know why you waste your time here.

I am doing two things. Firstly, I am campaigning to END all morse code
testing for any sort of USA radio license.

Secondly, I enjoy great amusement in puncturing the ego balloons of the
over-inflated credentialists who are so very ignorant of electronics
technology in general but insist that they are some kind of "experts" in
radio for having passed a few federal tests long ago.

YOUR only "interest" in being in this newsgroup seems to be as a sort
of public-relations venue to promote Larry Roll as an "expert" in AMATEUR
radio. YOU are not an expert in anything but a lot of bullshit shoveling
about your alleged accomplishments and "skills."

>> Hey, like you are "qualified to land any human resources (personnel)
>> job because of your alleged high grades" and wind up driving a BUS?
>
>You've still never provided that exact quote, Lennie, but the fact is, bus
>driving pays better in these parts.

Poor baby. Still trying to divert everyone to living in Google archives
so that they don't have to confront the real subjects here?

If you are so set on driving a bus, why did you waste all your time in
college classes on NON-transportation subjects?

>> Like you've NEVER worked any military communications in your entire
>> TWENTY except a telephone on your desk?
>
>I've used lotsa LMR radios, but I was in transportation, not Comm. As I
>already said thousands of times, I'm strictly an AMATEUR radio
>operator.

Yes, and that is all you will ever be. A hobbyist in one small field of
electronics called "ham radio." You seem to be ignorant of basic
electronics, field and wave propagation knowledge unless it is spoon-
fed you through ARRL publications. Supposedly the vast majority of
amateur radio communications modes you say you use is telegraphy
(voice is only "1%"). All you seem to have done is to promote your-
self (or at least your ego) in here and been a dilettante in ham radio
using already-built equipment (that you may not understand in theory).

You are an AMATEUR in radio is all senses of that word.

>> Tell me all about your "qualifications" for judgement about anyone, big
>> shot. You seem to forget all the BS you were spouting about "summa
>> cum laude" and "landing any (important) job you wanted." You wound

>> up DRIVING A BUS.
>
>C'mon, Lennie. Show us the quote!

No need. You said it in here. You now drive a bus. You are a bus
driver with (supposedly) a Human Resources (personnel) degree and
a "twenty" from the USAF.

>Which, of course, is why I've been using PSK-31 since the moment it
>became available to radio amateurs!

Provide SOME proof of that ridiculous claim, Roll.

PSK31 is a method of on-air data communications using a very small
bandwidth, developed-innovated by Peter Martinez, G3PLX, in the UK.
PSK31 was in-use nearly two years in the UK and parts of Europe
before the first articles on it appeared in USA amateur radio publications.

You are, as usual, doing considerable bullshitting again.

I'm familiar with Peter Martinez' various innovations since 1973 and his
experiments with polyphase filter SSB generation-demodulation as
published in Radio Communications magazine of that year.

>However, I guess there must have
>been a lot of PSK-31 being used in the '30's, if you are to be believed.

Sorry, but you are telling LIES again, Roll. I've never ever claimed
that "PSK31 was in use in the 1930s."

TELEPRINTERS were in wide use in commercial/government radio in
the 1930s. So much so that the first SSB circuits on HF radio of that
period carried six to eight TTY channels each (in addition to two voice
bandwidth channels).

TELEPRINTERS were already taking over telegraphy service providers
in 1900 and continued to grow in use until the 1960s when faster, quieter,
more reliable "data" modes supplanted them. Manual telegraphers were
"downsized" and sought a venue for their no-longer-needed skills in such
places as amateur radio.

>I make lotsa PSK-31 contacts, Lennie -- just not with anyone on this
>newsgroup…well, not with any NCTA's, at least!

Again, just a braggart's claim. Provide SOME form of proof of that.

>Fine, good. I've never questioned that. However, you seem to think it is
>necessary to keep driving that point home over and over. Kinda makes one
>wonder who you're trying to convince?

I'm not trying to "convince" you, Roll. Your ego is such that you will not
accept any debate or challenge of proof on your claims.

Your comments in this newsgroup wind up as being springboards for
exposing the attitudes of certain vocal long-timers who wish to continue

DUMBING DOWN US amateur radio by keeping them held to the
standards and practices of 70 years ago.

>What I have, Lennie, is a job that I like, that I enjoy doing, that gives me
>a lot of satisfaction working with people who really need my services, and
>has pay and benefits way above what I could get in any entry-level HR
>job.

Okay, you "enjoy your job." Sure. But...that job has NOTHING TO DO
WITH RADIO. :-)

>Moreover, my fellow bus drivers come from all walks of life and
>many professional occupations, and many are fellow college graduates.

That's nice. Supervisors need a Masters Degree, do they? Transport
Supervisors need PhDs? :-)

>So what is YOUR problem with MY job?

I have no real dispute with YOUR job...except when you try to pull the usual
bullshit of yours on everyone else...such as "a professional (in radio) does
not have any experience in ham radio." :-)

Sooner or later you will HAVE to come to grips with the reality of radio
physics that human legislation does NOT change said physics. The
technology of radio, electronics, fields and waves remains the SAME
regardless of human laws separating radio services.

>Yes, I may have one time
>indulged in idle speculation that I could get a good HR job, but then, I was
>unfamiliar with the realities of life regarding that field -- mainly that it
is
>dominated by women and minorities, and doesn't pay well except at
>the highest levels of experience and responsibility.

So, misogyny aside, you could not bear to enter into any field in an
ENTRY level position?

Sounds that way to me.

Yet you DEMAND that all ham radio newcomers go into the same sort
of ENTRY LEVEL, starting at the bottom and working their way up...in a
HOBBY ACTIVITY. Makes no sense logically...makes sense only when
coupled to your well-displayed ego.

Ah, but YOU could NOT accept any ENTRY LEVEL position in a JOB
even though you had a military service pension benefit or could have
parlayed that military experience in a government job. YOU have to
"start at the top?"

>Pot -- Kettle -- Black. Your specialty.

I was never into cooking utensil design or manufacture. :-)

What I've shown in here so far is a lot of hypocrisy and mythology
demonstrated by long-time ham radio operators about their hobby.
If pointing out that such hypocrisy and mythology creates soot, smutz,
and dirt by the hypocrites and legend-spewers, then that's just too bad.
Soot, smutz, dirt is still soot, smutz, and dirt.

>I addressed my personal need for a job with good pay and benefits, and
>adapted to reality, Lennie. I probably could have got a low-level HR
>job if I were willing to make an expensive relocation to a much higher
>cost of living area at my own expense. I chose not to. You do understand
>basic economics, don't you, Lennie?

I'm very much aware of "economics" at many levels, basic to advanced.

I'm also very much aware of bullshit artists trying to sell themselves even
though their "product" is just vapor.

>And all you're good for is making loud sucking sounds, Lennie.
>
>Putz! (Apologies to Steve)

Now everyone can realize that, despite a BA in "Human Resources,"
you do NOT have a second career in that...

> When a standard must maintained, whether it be a ham license, or a pilots
> license, then a test is required. Otherwise the quality goes down.

only if the maintained standard is directly relavent to the operation of
what is
being spoken of.

Adherence to the rules, paying attention to "gentleman's agreements", and
following all the rules and regulations are not mutually inclusive with that
of morse code skill.

If THAT was the fact, the overwhelming number of violaters on the 40 and
75m bands (who were legally licensed, with 13 and 20 wmp code testing)
would NOT have done what they did; it sounded like channel 19
cb for many years before hollingsworth helped to clean it up (more proof
that code testing is NOT a "yahoo filter")

>
> CW is a tradition in the ARS.

as is FM, ssb, AM, etc.....

It is a valuble mode of communications.]

as is FM, ssb, AM, etc...

> However, it requires a certain amount of dedication and desire to maintain
> your ability to work the mode.

as is FM, ssb, AM, etc...

>
> In otherwords advocating freedom of choice has nothing to do with getting
a
> ham license.

I was saying that in response to the accusation that I was forceing an idea
on
somebody; I was doing just the opposite... advocating a greater range
of freedom of choice.

>People SHOULD NOT be able to force a change on the licensing
> authorities, based mainly on being too lazy to try to meet the standard.

it's a representative republic; the very cornerstone of democracy is that
the people are able to effect change when they feel it necessary for
whatever reason THEY feel. The idea that it's because they're "too lazy

to try to meet the standard" is simply your spin & rhetoric.

>
> Why should those of us that have the dedication have to be forced to have
> our privlidges reduced by those among us that are too lazy to bother to
meet
> the standards we did?

I wasn't aware that the NCTA crowd was advocating reducing your frequency
priviledges. Or, is that more spin? As far as I know, you and other
licensees
were going to retain all the priviledges they had before the testing reform.

By the way, thak you for including the latter part of the comment, PROVING
I was right... that it all boils down to nothing MORE than "I did it, so
waaaaa
waaaa waaaaa, everybody should have to be forced to do it!!!!!"

>Should be rejoice at this? I don't think so.

if it were true, no. But it's not. Your priviledges will not change; you
will be able
to transmit on all the frequencies that you could before the reform.

>
> We know that is what you SAY. The reality of the situation is based on
the
> simple knowledge that human beings will take the easy way. Once CW
testing
> is elliminated, CW use will eventually dissapear. Folks simply will not
> bother to learn it.

OH! so you admit the OTHER half of the AWEFUL truth! it comes down to
you want to FORCE people to do something they don't want to do necessarily
of thier own free will! well, the thing that made america so powerful, such
that
in 200 years +, we have surpassed nations in economic power that have been
on the planet for THOUSANDS of years, was that the free market forces were
allowed to decide what course the market would take... and low and behold,
the united states economic output is one third that of the total of the
ENTIRE
world..... that is, a nation with only 4.5% of the population has an
economic
value of 33% (about 11 trillion out of 34 trillion dollars) that of ALL
nations
combined....

...if people worked morse code ONLY because they were forced to, then
I doubt they would use it at all... that is to say, these same people would
only pass the code test and then not use CW if they really didn't have thier
hearts into it. If that was the ONLY thing keeping CW alive, it would
have died a long time ago. But the bands are full of CW operators that
are using it of thier own free will.

If the free market determines that it no longer wants it, than keeping it around is tantamount to nothing more than subsidizing a mode of communications. You will certainly NOT make any more fans or lovers of the code by MAKING them do it.

>
> I honestly don't think that 5 words per minute is asking too much to gain

What IS it with this RIGHTEOUS WRATH stuff, Ah-nold?

Are you so lacking in counter-arguments, have such thin skin that you
can't handle strong opposition that you bring out this ARTIFICIALITY
of "insults to ancestors?"

Rhetorically asking on my part. Of course you are deficient on both
counts. We all knew that. You don't have a good reason for keeping the
code test. You supposedly have me in some "kill file" so you can't be
disturbed by harsh words against your opinions. Tsk, tsk. No guts.

Drop all the "insult to ancestors" crap and GET REAL.

>This is a serious subject.

Yes. Ah-nold the Codinator got his sword knotted.

>I'm
>a few years older than you, so it stands to reason that I've had the
>opportunity to speak directly with many of the members of my family who
>survived the Nazis' attempt to exterminate them in Poland.

Kiddo, I'm a few years older than YOU, but don't have any "ancestors"
who were in concentration camps. Instead, I've talked DIRECTLY to
those who were there, even a couple of ex-soldiers who helped
liberate one camp. Lots of those centers for Holocaust remembrance
here in Los Angeles.

Cut out this totally artificial-to-the-subject "ancestral insult" crap.

The word "nazi" (all lower case) has come to mean what Clint said
in the American language of TODAY.

>I listened to
>them many times over as a young man and understand fully the meaning of the
>word. I don't subscribe to your loose definition, and neither do the many
>people who lived under that tyranny. When you use it to describe those that
>are in favor of code testing in the ARS, you cheapen the meaning, and
>therefore the memories of all those people who did not survive.

You ought to run right down to your nearest Simon Weisenthal Center
and TELL THEM ABOUT YOUR OUTRAGE!!!!

>Please,
>think about this before you use the word again. That's all that I ask.

If the "ancestral outrage/insult" ploy is the best thing you can come up
with in a newsgroup concerning the MORSE CODE TEST FOR
AMATEUR RADIO LICENSING, you might as well quit trying to post
anything. Your artificiality has lost it for you. Negative message points.

Yeah, riiiiiight, "Leo." :-)

Want to be a world-reknowned theoretical astrophysicist? No problem,
just contract some bad neural disease, go to an ivy-covered UK college
and write a few books. All you have to do is WILL yourself...for about
3 millenia. By that time, astrophysics will have become "easy" for you.

Want to be a famous artist and be featured in national magazines even
though you don't have have any art talent at all? No problem. WILL
yourself to draw/paint, spend hours at it...but hire a very good publicist
so you can become a "Grandpa Moses." [we've already had a Grandma]

>I am certainly no prodigy at morse, electronics, martial
>arts, cooking, business management or anything else - but I have
>always been able to accomplish the things that I was motivated to do.

...or conveniently FORGET those things you were not able to do...

>Mind you, it took me until I was 45 to become motivated enough to
>learn morse code - but I wanted to get on HF, focused on the goal,
>bought some training software online and passed the 5 wpm test four
>weeks later.

Oh, my. At age 20 I was ALREADY ON HF...and on VHF, on UHF,
on microwaves in Big Time communications before reaching 24...all
without any sort of morsemanship.

At age 26 I thought it might be a fun thing to learn morse code and
get a ham license to augment my First Phone license passed in '56.
Wasn't WORTH it to listen to all that beeping. I'd already done three
years of communications in the US Army, all of it trans-Pacific, all
without using or having to know morse code.

Doesn't make sense to me that, in this new millennium, AMATEURS
still DEMAND that everyone know morse in order to get a HAM license.

>Conversely, I have wanted to learn to play the guitar
>since I was a teenager - not sufficiently enough, though, as I never
>did do it. Which, in retrospect, is probably a good thing....

What?!? NO MOTIVATION!?! Terrible!

Can't you even do simple chords on a git-box?

I never had that problem. Next door neighbor was a part-time guitarist. Designed and built a portable amplifier to fit inside his guitar. Not a big boom-box with 5 KW of acoustic power...was way back in '63 when guitars were first getting popular. Design from scratch was no problem for me, nor the hardware. I liked drums better.

>Talent has very little to do with accomplishment (it does relate to
>the level of excellence that one can attain, but to become reasonably
>proficient in anything talent is not a factor), especially in ventures
>based primarily on rote repetition like morse, Karate, or learning a
>language.

HAH!!!!

I happen to have a talent for languages and have the physical equipment to speak with very little "English" dialect. I know others MORE literate (through formal schooling) in the same language as I know but have atrocious accents and can't always form written sentences in that language. They can spend decades of such study and will never get it down properly. Not a problem for me.

I just don't see any sense in maintaining a federal morse code test in this day and age for a HOBBY activity. I've been doing REAL HF comm long before nearly all of these old-timer morsemen without needing any HOBBY code test.

>Blaming a lack of talent for failure to accomplish something reflects
>on a persons' own inability to accept responsibility for their own
>actions - successful people, quite simply, go out and get what they
>want. Or, in the words of Albert Gray:

Yes, WANT violin playing ability on par with Itzak Perlman badly enough and it can be done?

WANT to be a baseball great like the Mariner's John Olerud and it can be done just by determination and practice?

"Will and idea" (and determination) is all that is necessary?

I don't think so.

The existance of the morse code test for an AMATEUR radio license is NOT some moral bullshit thing of "will and determination." There's NO divine idea that the morse code test must always be. AMATEUR radio is a hobby, not a Premium Life Accomplishment.

I think some of you have wigged-out too far and need investigation for Illegal substance abuse...

I think that may be a prevailing sentiment and character
trait of that crowd, actually.

After talking to them enough, you FINALLY get out
of them, as I have, the truth (but I suspected it all along).

It's is tantamount to an authoritarian's way of running
a government. Free market forces aren't to dictate
policy or courses of action, but the pointing of fingers
and swinging of riding crops IS. If you read the
various responses that a few of the PCTA types have
made to all of our comments, it all boils down to the following
doctrine...

(1) I had to do it, so should YOU.
(2) It shouldn't be up to a free citizen to operate as he sees
fit; he should do what he's told, for the better good of
the existence of the archaic mode in question (CW)
(3) Shut up, your opinion in the operation of the government
(read: FCC) doesn't matter, and you should not have the
the right to have any influence on how it governs you;
you're the subject of the empire.
(4) The public at large (ham radio operators) should NOT
be BURDENED with having to make choices; they
should not have the freedom to choose how to use
thier skills to the ends that they see fit; such is an
IMPOSITION upon them.

4657. Play the Art Bell Drinking Game tonight !!

Newsgroup: rec.radio.amateur.policy
Date: 2003-09-21 00:41:43 UTC
From: Beloved Leader #4 <profishwrapper@yahoo.com>
Message-ID: <1064105442.55001@newshost03.voicenet.com>
Source record: 78172
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.shortwave

As you probably know by now, tonight Art Bell returns
to host Coast to Coast AM. In honor of this (his latest
return from retirement...again) we present:

******* The Art Bell Drinking Game ********

taken from http://www.skepticult.org/artpar/Drunk.htm

Supplies needed for play

*One bottle of Wild Turkey Bourbon per player

*One six-pack of beer per player preferably
generic or Rolling Rock to keep with the Art
Bell theme

*One shot glass per player

*One 16 oz beer mug per player

*One AM radio or Internet RealAudio set to to www.coasttocoastam.com

How to play :

Tune your radio to Art Bell Coast to Coast or Dreamland

When Art uses the words "anomaly" or "paradigm" incorrectly, everyone
drinks a shot of wild turkey.

When Art uses the words "anomaly" or "paradigm" correctly, everyone guzzles
a boilermaker.

When Art uses the phrase "It's all starting to come together" everyone must
remove an article of clothing and yells: "Beam me up Scotty!
(this part has no effect on the outcome of the game, but it's a hell of a
lot of fun).

Winning the game :

The last person to remain conscious wins the game. Under normal conditions,
a winner is determined in the first 45 minutes of Art's show.

> not tell you that.

here's a more accurate anology....

"You can't possibly know anything about pizza, and i'm telling you that it's an important staple to you diet. Your opinion means nothing; I am now pointing the gun of licenseing system at your head and ORDERING you to take a bite of the pizza, I am not worried one bit about what the facts are or what the market wants... I am going to see to it that everybody is force fed pizza whether they like it or not."

That was my EXACT point in an earlier post.... I was told by a certain
PCTA type that "it won't exist anymore unless we force it on everybody"...
well, heh, according to darwin and also the free market, the most fit
survive and the free market, left to run the course as it will in and of
its own needs will result in the best suited result.

If you have to MAKE it happen, then it isn't making it on it's own
merit.

> >>
> >> I'm afraid of your motives in all this, Larry. I don't like the words

Well said !!

Echolink's performance during the Hurricane
Emergency exposed the TECHNOLOGICAL
OBSOLENCE of traditional SSB Amateur Radio.

And there's N O B O D Y who can dispute that
from a rational technological perspective.

Arnie, that's the mindset of the codefree New Agers. They can't make
in the environment that we made it within, so the proper thing for them
to do is demonize that environment so that none of them should have to
do so. In so doing they also demonize everyone who finds nothing
threatening nor untoward about that environment.
It's a classic case of destroy that which you can't attain. If you
can't make it to the top, work the top down to something you can get to.
What a shame.

Ah, yes. It is so!

The October QST shows the DMSP night-time visual image of North
America, during the big black out. Very worthwhile to take a look at.
And not a single pixel of it was sent using Morse Code.

;^) Brian

That's about the extent of the mental capacity of the no-coder, Mike.
They have too little vision to
be able to see value in radiotelegraphy, so all they can see is that
anyone who has that capacity must be on the far opposite end of the scale.

One must ponder their IQ. For the most part it's down with the whale
offal.

Well in the case of Amateur Radio, *we* are the market. A recent (June 5, 2003) survey done in the Dakota Division is quite enlightening. Here are some of the results that are specifically related to Morse Code:

"Division members are divided on the Entry level license with slightly more of those replying saying that Morse Code should not be required for access to HF. That changes as as we move to General and Extra. Nearly 70% say there should be a Morse requirement for Extra Class licensees.

Two areas are particularly interesting. Nearly 94% said we should continue to keep a CW and data band segement even if the Morse Code Requirement was eliminated. More than 83% said the Entry level license should have some HF privileges."

This survey indicates that there is not the groundswell of support for the complete removal of CW testing that is claimed by the NCTA side of this debate.

Wow, you mean if I prearrange it, the VEC will actually comply with Part 97?

Tell you what though, even counting dots and
> dashes, letters at that slow speed are painful to decipher. Plus there is

If I knew Morse Code at 13-15 wpm, that is.

> At a character speed of 5wpm, you can't hear the letter as a letter and you
> can't react to the sound on a reflex basis.

But, Dee, I passed the Novice test with 100% copy.

Not necessarilly. If one knows the ingredients of pizza, they do not have
to eat it to know whether they would like it or not.

Depends. If it's a chocolate cake and we know that we can't *really* taste
the eggs (I can't stand eggs), then I'm pretty sure I'd like a chocolate
cake.

Since when did it become a "private" frequency? The H.F. Frequencies used for Ham operation are open to any one with the proper class of license to use them. Of course common courtesy does count when the frequency may already be in use. No wonder people are turning away from Ham. It is getting horrible. Used to be, I boasted it to anyone interested. Now, I tell them not to waste their time. It is getting to be High Power CB. As for the FCC, they have lost the battle so far as I'm concerned. The horses are out of the barn. TOO LATE! I'm about ready to sell all my ham gear.. Get my cash out of it while there is still some value left to it. I would NEVER buy a new rig again, that is for sure. I'll buy "used" if I decide to stay in it. It just isn't worth the huge cash lay out.

Actually, since the FCC works for all Americans, the American people are the market. Current operators represent less than one half of one percent of that market and we are not growing fast enough to even keep up with the normal population growth. To many, those facts strongly suggest a need for some serious changes.

> A recent (June 5, 2003) survey done in the Dakota Division is

> for the complete removal of CW testing that is claimed by the
> NCTA side of this debate.

I don't remember anyone saying there was groundswell support. Instead, most have argued about the current need for a license requirement.

Hmmmm -

It's amazing, but I keep hearing these 'sour grapes' attitudes from the old timers, both on the radio and in the newsgroups.

Fact is, if the Big Government changes the rules, and as a result somebody gets a licence just like yours without having to jump through all of the hoops that you did years ago, they still have a licence that allows them to do the same thing that yours does.

In other words, it's equal. Maybe not in terms of effort, but in all other respects and for all intents and purposes, equal.

That's a hard pill to swallow, especially if you pride yourself on passing a 20 WPM code test to get your Extra, and it only takes 5 WPM now. But, da rules is da rules, and someone who gets their Extra tomorrow morning with 5 WPM can do exactly what you can do on the air today. Same privileges, same modes, sames frequencies. Same licence! And soon, when code is retired, it will be 0 WPM to get in and play.

Fact is, the FCC makes the rules, and you and I follow 'em. Simple as that. Like it or not, you don't control the process. You live with it, like everybody else. Time was, an Extra was WAY up there in the amateur ranks (20 WPM is bloody hard!!) - today, it's simply a ticket to use a small additional frequency allocation. Nothing more - no big status thing to lord over everybody else! Still a lot of theory in the test, but it can be done by memorizing the question bank answers - I proved that a week ago Friday.

That's just the way it is, Friend - deal with it, or be bitter and upset - it's your choice! Either way, as long as you're endlessly debating the issue over here on Usenet, you're off the air - and we're having a blast QSOing in your absence!

CB Plus - maybe, same as yours, after devaluation!

88's
Eddie - Extra Class Amateur Licence

...5 WPM Extra as of Sept. 12th, 2003 (gotta LOVE that big nickel!)...

> test, which shows that you could, indeed, demonstrate some aptitude.

I'm sure I have some small residual glimmer of aptitude for all manner of
things that I am no bloody good at. For example, I can swim, albeit just
barely, but I am obviously a poor candidate for an olympic swimming team
position! In the same way, having been able to tell the difference between
'name is Frank' and 'name is Hank' at 13 and 20 wpm, after 23 years (up to
that point) of attempting to learn the Morse code, doesn't mean that I
would be a good choice to man a CW station in a contest.

> your way.
>

Where there is no interest, progress is usually poor. Ask any teacher.

>>Who knows why I should be good

And no doubt macrame and ornithology as well, but what would be the point?

> Whether you realize it or not, you have that potential within you. You
> just don't want to tap into it -- and that's attitude.
>

No, and yes, respectively.

>>Each of us has innate abilities in some things, balanced by innate

>>with me and Morse code. I did it eventually, with a huge amount of
>>outside help, without which I would never have succeeded on my own. The
>>reason I didn't
>> succeed earlier is straightforward - I didn't get help before.
>
> All of the above makes my point about attutude.

No, the point is that I was so bad that I needed help. You insist on missing that point as it doesn't agree with your views.

This comes down to a much more fundamental debate that takes the discussion away from Morse Code. Namely, the old one about 'nature v. nurture'. I lean heavily towards the nature end of the scale. That is I beleive that 9/10ths of our abilities are innate. It is posssible for innate talents to fail to be developed. It is also possible for people to overcome their lack of talent in many areas, often only with a great deal of effort.

Luckily, there is no requirement for pro-code brainwashing to hold an amateur radio licence! (although some expend all possible efforts to do so).

>>No doubt CW is very useful, but I am no
>>bloody good at it, and I prefer to actually _talk_ on the radio in the
